- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

25.2.4.1.5.1.5.4. MySQLHelper.ExecuteScalar Method (String, String, MySqlParameter[])

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
```

```
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
stringconnectionString,  
stringcommandText,  
params MySqlParameter[]commandParameters  
);
```

Parameters

- `connectionString`: Settings to use for the command
- `commandText`: Command text to use for the command
- `commandParameters`: Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

25.2.4.1.5.1.6. MySqlHelper.UpdateDataSet Method

Updates the given table with data from the given DataSet

Syntax: Visual Basic

```
Public Shared Sub UpdateDataSet( _  
ByVal connectionString As String, _  
ByVal commandText As String, _  
ByVal ds As DataSet, _  
ByVal tablename As String _  
)
```

Syntax: C#

```
public static void UpdateDataSet(  
stringconnectionString,  
stringcommandText,  
DataSetds,  
stringtablename  
);
```

Parameters

- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update
- `ds`: DataSetcontaining the new data to use in the update
- `tablename`: Tablename in the dataset to update

Public Instance Constructors

MySqlConnectionException Constructor	Ctor
--	------

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.

StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

Protected Instance Properties

HResult(inherited from Exception)	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception.
-----------------------------------	---

Protected Instance Methods

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

Public Static (Shared) Type Conversions

Explicit MySQLDateTime to DateTime Conversion	
---	--

Public Instance Properties

Day	Returns the day portion of this datetime
Hour	Returns the hour portion of this datetime
IsNull (inherited from MySQLValue)	
IsValidDateTime	Indicates if this object contains a value that can be represented as a DateTime
Minute	Returns the minute portion of this datetime
Month	Returns the month portion of this datetime
Second	Returns the second portion of this datetime
ValueAsObject (inherited from MySQLValue)	Returns the value of this field as an object

Year	Returns the year portion of this datetime
----------------------	---

Public Instance Methods

Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetDateTime	Returns this value as a DateTime
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType (inherited from Object)	Gets the Type of the current instance.
ToString	Returns a MySQL specific string representation of this value

Protected Instance Fields

classType (inherited from MySqlValue)	The system type represented by this value
dbType (inherited from MySqlValue)	The generic dbtype of this value
isNull (inherited from MySqlValue)	Is this value null
mysqlDbType (inherited from MySqlValue)	The specific MySQL db type
mysqlTypeName (inherited from MySqlValue)	The MySQL specific typename of this value
objectValue (inherited from MySqlValue)	

Protected Instance Methods

Finalize (inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone (inherited from Object)	Creates a shallow copy of the current Object.

25.2.5. Connector/NET Notes and Tips

In this section we will cover some of the more common use cases for Connector/NET, including BLOB handling, date handling, and using Connector/NET with common tools such as Crystal Reports.

25.2.5.1. Connecting to MySQL Using Connector/NET

25.2.5.1.1. Introduction

All interaction between a .NET application and the MySQL server is routed through a [MySQLConnec-](#)

tion object. Before your application can interact with the server, a `MySQLConnection` object must be instantiated, configured, and opened.

Even when using the `MySQLHelper` class, a `MySQLConnection` object is created by the helper class.

In this section, we will describe how to connect to MySQL using the `MySQLConnection` object.

25.2.5.1.2. Creating a Connection String

The `MySQLConnection` object is configured using a connection string. A connection string contains sever key/value pairs, separated by semicolons. Each key/value pair is joined with an equals sign.

The following is a sample connection string:

```
Server=127.0.0.1;Uid=root;Pwd=12345;Database=test;
```

In this example, the `MySQLConnection` object is configured to connect to a MySQL server at `127.0.0.1`, with a username of `root` and a password of `12345`. The default database for all statements will be the `test` database.

The following options are typically used (a full list of options is available in the API documentation for [Section 25.2.3.3.15, "ConnectionString"](#)):

- **Server:** The name or network address of the instance of MySQL to which to connect. The default is `localhost`. Aliases include `host`, `Data Source`, `DataSource`, `Address`, `Addr` and `Network Address`.
- **Uid:** The MySQL user account to use when connecting. Aliases include `User Id`, `Username` and `User name`.
- **Pwd:** The password for the MySQL account being used. Alias `Password` can also be used.
- **Database:** The default database that all statements are applied to. Default is `mysql`. Alias `Initial Catalog` can also be used.
- **Port:** The port MySQL is using to listen for connections. Default is `3306`. Specify `-1` for this value to use a named-pipe connection.

25.2.5.1.3. Opening a Connection

Once you have created a connection string it can be used to open a connection to the MySQL server.

The following code is used to create a `MySQLConnection` object, assign the connection string, and open the connection.

Visual Basic Example

```
Dim conn As New MySql.Data.MySqlClient.MySqlConnection
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    conn.ConnectionString = myConnectionString
    conn.Open()
```

```
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection();
    conn.ConnectionString = myConnectionString;
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

You can also pass the connection string to the constructor of the [MySqlConnection](#) class:

Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

Once the connection is open it can be used by the other Connector/.NET classes to communicate with the MySQL server.

25.2.5.1.4. Handling Connection Errors

Because connecting to an external server is unpredictable, it is important to add error handling to your .NET application. When there is an error connecting, the [MySqlConnection](#) class will return a [MySqlException](#) object. This object has two properties that are of interest when handling errors:

- **Message**: A message that describes the current exception.
- **Number**: The MySQL error number.

When handling errors, you can your application's response based on the error number. The two most common error numbers when connecting are as follows:

- **0**: Cannot connect to server.
- **1045**: Invalid username and/or password.

The following code shows how to adapt the application's response based on the actual error:

Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    Select Case ex.Number
        Case 0
            MessageBox.Show("Cannot connect to server. Contact administrator")
        Case 1045
            MessageBox.Show("Invalid username/password, please try again")
    End Select
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    switch (ex.Number)
    {
        case 0:
            MessageBox.Show("Cannot connect to server. Contact administrator");
        case 1045:
            MessageBox.Show("Invalid username/password, please try again");
    }
}
```

Important: Note that if you are using multilanguage databases you must specify the character set in the connection string. If you do not specify the character set, the connection defaults to the `latin1` charset. You can specify the character set as part of the connection string, for example:

```
MySqlConnection myConnection = new MySqlConnection("server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;Charset=latin1;");
```

25.2.5.2. Using the Connector/NET with Prepared Statements

25.2.5.2.1. Introduction

As of MySQL 4.1, it is possible to use prepared statements with Connector/NET. Use of prepared statements can provide significant performance improvements on queries that are executed more than once.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

25.2.5.2.2. Preparing Statements in Connector/NET

To prepare a statement, create a command object and set the `.CommandText` property to your query.

After entering your statement, call the `.Prepare` method of the `MySQLCommand` object. After the statement is prepared, add parameters for each of the dynamic elements in the query.

After you enter your query and enter parameters, execute the statement using the `.ExecuteNonQuery()`, `.ExecuteScalar()`, or `.ExecuteReader` methods.

For subsequent executions, you need only modify the values of the parameters and call the execute method again, there is no need to set the `.CommandText` property or redefine the parameters.

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = strConnection

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)"
    cmd.Prepare()

    cmd.Parameters.Add("?number", 1)
    cmd.Parameters.Add("?text", "One")

    For i = 1 To 1000
        cmd.Parameters["?number"].Value = i
        cmd.Parameters["?text"].Value = "A string value"

        cmd.ExecuteNonQuery()
    Next
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.YesNo)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = strConnection;

try
```

```
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)";
    cmd.Prepare();

    cmd.Parameters.Add("?number", 1);
    cmd.Parameters.Add("?text", "One");

    for (int i=1; i <= 1000; i++)
    {
        cmd.Parameters["?number"].Value = i;
        cmd.Parameters["?text"].Value = "A string value";

        cmd.ExecuteNonQuery();
    }
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

25.2.5.3. Accessing Stored Procedures with Connector/NET

25.2.5.3.1. Introduction

With the release of MySQL version 5 the MySQL server now supports stored procedures with the SQL 2003 stored procedure syntax.

A stored procedure is a set of SQL statements that can be stored in the server. Once this has been done, clients don't need to keep reissuing the individual statements but can refer to the stored procedure instead.

Stored procedures can be particularly useful in situations such as the following:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures for all common operations. This provides a consistent and secure environment, and procedures can ensure that each operation is properly logged. In such a setup, applications and users would not get any access to the database tables directly, but can only execute specific stored procedures.

Connector/NET supports the calling of stored procedures through the `MySqlCommand` object. Data can be passed in and out of a MySQL stored procedure through use of the `MySqlCommand.Parameters` collection.

Note: When you call a stored procedure, the command object makes an additional `SELECT` call to determine the parameters of the stored procedure. You must ensure that the user calling the procedure has the `SELECT` privilege on the `mysql.proc` table to enable them to verify the parameters. Failure to do this will result in an error when calling the procedure.

This section will not provide in-depth information on creating Stored Procedures. For such information, please refer to <http://dev.mysql.com/doc/mysql/en/stored-procedures.html>.

A sample application demonstrating how to use stored procedures with Connector/NET can be found in the `Samples` directory of your Connector/NET installation.

25.2.5.3.2. Creating Stored Procedures from Connector/NET

Stored procedures in MySQL can be created using a variety of tools. First, stored procedures can be created using the [mysql](#) command-line client. Second, stored procedures can be created using the [MySQL Query Browser](#) GUI client. Finally, stored procedures can be created using the [.ExecuteNonQuery](#) method of the [MySqlCommand](#) object:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" & _
    & "uid=root;" & _
    & "pwd=12345;" & _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "CREATE PROCEDURE add_emp(" & _
        & "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " & _
        & "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " & _
        & "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END"

    cmd.ExecuteNonQuery()
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "CREATE PROCEDURE add_emp(" +
        "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " +
        "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " +
        "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END";

    cmd.ExecuteNonQuery();
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

It should be noted that, unlike the command-line and GUI clients, you are not required to specify a special delimiter when creating stored procedures in Connector/NET.

25.2.5.3.3. Calling a Stored Procedure from Connector/NET

To call a stored procedure using Connector/NET, create a [MySqlCommand](#) object and pass the stored procedure name as the [.CommandText](#) property. Set the [.CommandType](#) property to [CommandType.StoredProcedure](#).

After the stored procedure is named, create one [MySqlCommand](#) parameter for every parameter in the stored procedure. [IN](#) parameters are defined with the parameter name and the object containing the value, [OUT](#) parameters are defined with the parameter name and the datatype that is expected to be re-

turned. All parameters need the parameter direction defined.

After defining parameters, call the stored procedure by using the `MySqlCommand.ExecuteNonQuery()` method:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "add_emp"
    cmd.CommandType = CommandType.StoredProcedure

    cmd.Parameters.Add("?lname", 'Jones')
    cmd.Parameters["?lname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?fname", 'Tom')
    cmd.Parameters["?fname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?bday", #12/13/1977 2:17:36 PM#)
    cmd.Parameters["?bday"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?empno", MySqlDbType.Int32)
    cmd.Parameters["?empno"].Direction = ParameterDirection.Output

    cmd.ExecuteNonQuery()

    MessageBox.Show(cmd.Parameters["?empno"].Value)
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "add_emp";
    cmd.CommandType = CommandType.StoredProcedure;

    cmd.Parameters.Add("?lname", "Jones");
    cmd.Parameters["?lname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?fname", "Tom");
    cmd.Parameters["?fname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?bday", DateTime.Parse("12/13/1977 2:17:36 PM"));
    cmd.Parameters["?bday"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?empno", MySqlDbType.Int32);
    cmd.Parameters["?empno"].Direction = ParameterDirection.Output;

    cmd.ExecuteNonQuery();

    MessageBox.Show(cmd.Parameters["?empno"].Value);
}
catch (MySql.Data.MySqlClient.MySqlException ex)
```

```
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

Once the stored procedure is called, the values of output parameters can be retrieved by using the `.Value` property of the `MySQLConnector.Parameters` collection.

25.2.5.4. Handling BLOB Data With Connector/NET

25.2.5.4.1. Introduction

One common use for MySQL is the storage of binary data in `BLOB` columns. MySQL supports four different BLOB datatypes: `TINYBLOB`, `BLOB`, `MEDIUMBLOB`, and `LONGBLOB`.

Data stored in a BLOB column can be accessed using Connector/NET and manipulated using client-side code. There are no special requirements for using Connector/NET with BLOB data.

Simple code examples will be presented within this section, and a full sample application can be found in the `Samples` directory of the Connector/NET installation.

25.2.5.4.2. Preparing the MySQL Server

The first step in using MySQL with BLOB data is to configure the server. Let's start by creating a table to be accessed. In my file tables, I usually have four columns: an `AUTO_INCREMENT` column of appropriate size (`UNSIGNED SMALLINT`) to serve as a primary key to identify the file, a `VARCHAR` column that stores the filename, an `UNSIGNED MEDIUMINT` column that stores the size of the file, and a `MEDIUMBLOB` column that stores the file itself. For this example, I will use the following table definition:

```
CREATE TABLE file(
file_id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
file_name VARCHAR(64) NOT NULL,
file_size MEDIUMINT UNSIGNED NOT NULL,
file MEDIUMBLOB NOT NULL);
```

After creating a table, you may need to modify the `max_allowed_packet` system variable. This variable determines how large of a packet (i.e. a single row) can be sent to the MySQL server. By default, the server will only accept a maximum size of 1 meg from our client application. If you do not intend to exceed 1 meg, this should be fine. If you do intend to exceed 1 meg in your file transfers, this number has to be increased.

The `max_allowed_packet` option can be modified using MySQL Administrator's Startup Variables screen. Adjust the Maximum allowed option in the Memory section of the Networking tab to an appropriate setting. After adjusting the value, click the `Apply Changes` button and restart the server using the `Service Control` screen of MySQL Administrator. You can also adjust this value directly in the `my.cnf` file (add a line that reads `max_allowed_packet=xxM`), or use the `SET max_allowed_packet=xxM`; syntax from within MySQL.

Try to be conservative when setting `max_allowed_packet`, as transfers of BLOB data can take some time to complete. Try to set a value that will be adequate for your intended use and increase the value if necessary.

25.2.5.4.3. Writing a File to the Database

To write a file to a database we need to convert the file to a byte array, then use the byte array as a parameter to an `INSERT` query.

The following code opens a file using a `FileStream` object, reads it into a byte array, and inserts it into

the [file](#) table:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

Dim SQL As String

Dim FileSize As UInt32
Dim rawData() As Byte
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    fs = New FileStream("c:\image.png", FileMode.Open, FileAccess.Read)
    FileSize = fs.Length

    rawData = New Byte(FileSize) {}
    fs.Read(rawData, 0, FileSize)
    fs.Close()

    conn.Open()

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)"

    cmd.Connection = conn
    cmd.CommandText = SQL
    cmd.Parameters.Add("?FileName", strFileName)
    cmd.Parameters.Add("?FileSize", FileSize)
    cmd.Parameters.Add("?File", rawData)

    cmd.ExecuteNonQuery()

    MessageBox.Show("File Inserted into database successfully!", _
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", _
        MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    fs = new FileStream(@"c:\image.png", FileMode.Open, FileAccess.Read);
    FileSize = fs.Length;

    rawData = new byte[FileSize];
    fs.Read(rawData, 0, FileSize);
    fs.Close();

    conn.Open();

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)";

```

```

cmd.Connection = conn;
cmd.CommandText = SQL;
cmd.Parameters.Add("?FileName", strFileName);
cmd.Parameters.Add("?FileSize", FileSize);
cmd.Parameters.Add("?File", rawData);

cmd.ExecuteNonQuery();

MessageBox.Show("File Inserted into database successfully!",
    "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The `Read` method of the `FileStream` object is used to load the file into a byte array which is sized according to the `Length` property of the `FileStream` object.

After assigning the byte array as a parameter of the `MySqlCommand` object, the `ExecuteNonQuery` method is called and the BLOB is inserted into the `file` table.

25.2.5.4.4. Reading a BLOB from the Database to a File on Disk

Once a file is loaded into the `file` table, we can use the `MySqlDataReader` class to retrieve it.

The following code retrieves a row from the `file` table, then loads the data into a `FileStream` object to be written to disk:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myData As MySqlDataReader
Dim SQL As String
Dim rawData() As Byte
Dim FileSize As UInt32
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

SQL = "SELECT file_name, file_size, file FROM file"

Try
    conn.Open()

    cmd.Connection = conn
    cmd.CommandText = SQL

    myData = cmd.ExecuteReader

    If Not myData.HasRows Then Throw New Exception("There are no BLOBs to save")

    myData.Read()

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"))
    rawData = New Byte(FileSize) {}

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize)

    fs = New FileStream("C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write)
    fs.Write(rawData, 0, FileSize)
    fs.Close()

    MessageBox.Show("File successfully written to disk!", "Success!", MessageBoxButtons.OK, MessageBoxIcon.Information)

    myData.Close()

```

```

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySqlDataReader myData;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

SQL = "SELECT file_name, file_size, file FROM file";

try
{
    conn.Open();

    cmd.Connection = conn;
    cmd.CommandText = SQL;

    myData = cmd.ExecuteReader();

    if (! myData.HasRows)
        throw new Exception("There are no BLOBs to save");

    myData.Read();

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"));
    rawData = new byte[FileSize];

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize);

    fs = new FileStream(@"C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write);
    fs.Write(rawData, 0, FileSize);
    fs.Close();

    MessageBox.Show("File successfully written to disk!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    myData.Close();
    conn.Close();
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

After connecting, the contents of the `file` table are loaded into a `MySqlDataReader` object. The `GetBytes` method of the `MySqlDataReader` is used to load the BLOB into a byte array, which is then written to disk using a `FileStream` object.

The `GetOrdinal` method of the `MySqlDataReader` can be used to determine the integer index of a named column. Use of the `GetOrdinal` method prevents errors if the column order of the `SELECT` query is changed.

25.2.5.5. Using Connector/NET with Crystal Reports

25.2.5.5.1. Introduction

Crystal Reports is a common tool used by Windows application developers to perform reporting and document generation. In this section we will show how to use Crystal Reports XI with MySQL and Connector/NET.

25.2.5.5.2. Creating a Data Source

When creating a report in Crystal Reports there are two options for accessing the MySQL data while designing your report.

The first option is to use Connector/ODBC as an ADO data source when designing your report. You will be able to browse your database and choose tables and fields using drag and drop to build your report. The disadvantage of this approach is that additional work must be performed within your application to produce a dataset that matches the one expected by your report.

The second option is to create a dataset in VB.NET and save it as XML. This XML file can then be used to design a report. This works quite well when displaying the report in your application, but is less versatile at design time because you must choose all relevant columns when creating the dataset. If you forget a column you must re-create the dataset before the column can be added to the report.

The following code can be used to create a dataset from a query and write it to disk:

Visual Basic Example

```
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myData.WriteXml("C:\dataset.xml", XmlWriteMode.WriteSchema)
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;
```

```

myAdapter.SelectCommand = cmd;
myAdapter.Fill(myData);

myData.WriteXml(@"C:\dataset.xml", XmlWriteMode.WriteSchema);
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The resulting XML file can be used as an ADO.NET XML datasource when designing your report.

If you choose to design your reports using Connector/ODBC, it can be downloaded from [dev.mysql.com](http://dev.mysql.com/downloads/connector/odbc/3.51.html) [http://dev.mysql.com/downloads/connector/odbc/3.51.html].

25.2.5.5.3. Creating the Report

For most purposes the Standard Report wizard should help with the initial creation of a report. To start the wizard, open Crystal Reports and choose the New > Standard Report option from the File menu.

The wizard will first prompt you for a data source. If you are using Connector/ODBC as your data source, use the OLEDB provider for ODBC option from the OLE DB (ADO) tree instead of the ODBC (RDO) tree when choosing a data source. If using a saved dataset, choose the ADO.NET (XML) option and browse to your saved dataset.

The remainder of the report creation process is done automatically by the wizard.

After the report is created, choose the Report Options... entry of the File menu. Un-check the Save Data With Report option. This prevents saved data from interfering with the loading of data within our application.

25.2.5.5.4. Displaying the Report

To display a report we first populate a dataset with the data needed for the report, then load the report and bind it to the dataset. Finally we pass the report to the crViewer control for display to the user.

The following references are needed in a project that displays a report:

- CrystalDecisions.CrystalReports.Engine
- CrystalDecisions.ReportSource
- CrystalDecisions.Shared
- CrystalDecisions.Windows.Forms

The following code assumes that you created your report using a dataset saved using the code shown in [Section 25.2.5.5.2, "Creating a Data Source"](#), and have a crViewer control on your form named `myViewer`.

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySQL.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

```

```

Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = _
    "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()

    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.SetDataSource(myData)
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.SetDataSource(myData);
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

A new dataset is generated using the same query used to generate the previously saved dataset. Once the dataset is filled, a ReportDocument is used to load the report file and bind it to the dataset. The ReportDocument is then passed as the ReportSource of the crViewer.

This same approach is taken when a report is created from a single table using Connector/ODBC. The dataset replaces the table used in the report and the report is displayed properly.

When a report is created from multiple tables using Connector/ODBC, a dataset with multiple tables must be created in our application. This allows each table in the report data source to be replaced with a

report in the dataset.

We populate a dataset with multiple tables by providing multiple `SELECT` statements in our MySQL-Command object. These `SELECT` statements are based on the SQL query shown in Crystal Reports in the Database menu's Show SQL Query option. Assume the following query:

```
SELECT `country`.`Name`, `country`.`Continent`, `country`.`Population`, `city`.`Name`, `city`.`Populat
FROM `world`.`country` `country` LEFT OUTER JOIN `world`.`city` `city` ON `country`.`Code`=`city`.`Cour
ORDER BY `country`.`Continent`, `country`.`Name`, `city`.`Name`
```

This query is converted to two `SELECT` queries and displayed with the following code:

Visual Basic Example

```
Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER BY countrycode, name; " _
        & "SELECT name, population, code, continent FROM country ORDER BY continent, name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0))
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1))
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Err
End Try
```

C# Example

```
using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER " +
        "BY countrycode, name; SELECT name, population, code, continent FROM " +
        "country ORDER BY continent, name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);
}
```

```

myReport.Load(@".\world_report.rpt");
myReport.Database.Tables(0).SetDataSource(myData.Tables(0));
myReport.Database.Tables(1).SetDataSource(myData.Tables(1));
myViewer.ReportSource = myReport;
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

It is important to order the [SELECT](#) queries in alphabetical order, as this is the order the report will expect its source tables to be in. One `SetDataSource` statement is needed for each table in the report.

This approach can cause performance problems because Crystal Reports must bind the tables together on the client-side, which will be slower than using a pre-saved dataset.

25.2.5.6. Handling Date and Time Information in Connector/NET

25.2.5.6.1. Introduction

MySQL and the .NET languages handle date and time information differently, with MySQL allowing dates that cannot be represented by a .NET data type, such as '0000-00-00 00:00:00'. These differences can cause problems if not properly handled.

In this section we will demonstrate how to properly handle date and time information when using Connector/NET.

25.2.5.6.2. Problems when Using Invalid Dates

The differences in date handling can cause problems for developers who use invalid dates. Invalid MySQL dates cannot be loaded into native .NET `DateTime` objects, including `NULL` dates.

Because of this issue, .NET `DataSet` objects cannot be populated by the `Fill` method of the `MySqlDataAdapter` class as invalid dates will cause a `System.ArgumentOutOfRangeException` exception to occur.

25.2.5.6.3. Restricting Invalid Dates

The best solution to the date problem is to restrict users from entering invalid dates. This can be done on either the client or the server side.

Restricting invalid dates on the client side is as simple as always using the .NET `DateTime` class to handle dates. The `DateTime` class will only allow valid dates, ensuring that the values in your database are also valid. The disadvantage of this is that it is not useful in a mixed environment where .NET and non .NET code are used to manipulate the database, as each application must perform its own date validation.

Users of MySQL 5.0.2 and higher can use the new `traditional` SQL mode to restrict invalid date values. For information on using the `traditional` SQL mode, see [Section 5.2.6, “SQL Modes”](#).

25.2.5.6.4. Handling Invalid Dates

Although it is strongly recommended that you avoid the use of invalid dates within your .NET application, it is possible to use invalid dates by means of the `MySqlDateTime` datatype.

The `MySqlDateTime` datatype supports the same date values that are supported by the MySQL server. The default behavior of Connector/NET is to return a .NET `DateTime` object for valid date values, and return an error for invalid dates. This default can be modified to cause Connector/NET to return

`MySqlDateTime` objects for invalid dates.

To instruct Connector/NET to return a `MySqlDateTime` object for invalid dates, add the following line to your connection string:

```
Allow Zero Datetime=True
```

Please note that the use of the `MySqlDateTime` class can still be problematic. The following are some known issues:

1. Data binding for invalid dates can still cause errors (zero dates like 0000-00-00 do not seem to have this problem).
2. The `ToString` method return a date formatted in the standard MySQL format (for example, 2005-02-23 08:50:25). This differs from the `ToString` behavior of the .NET `DateTime` class.
3. The `MySqlDateTime` class supports NULL dates, while the .NET `DateTime` class does not. This can cause errors when trying to convert a `MySQLDateTime` to a `DateTime` if you do not check for NULL first.

Because of the known issues, the best recommendation is still to use only valid dates in your application.

25.2.5.6.5. Handling NULL Dates

The .NET `DateTime` datatype cannot handle `NULL` values. As such, when assigning values from a query to a `DateTime` variable, you must first check whether the value is in fact `NULL`.

When using a `MySqlDataReader`, use the `.IsDBNull` method to check whether a value is `NULL` before making the assignment:

Visual Basic Example

```
If Not myReader.IsDBNull(myReader.GetOrdinal("mytime")) Then
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"))
Else
    myTime = DateTime.MinValue
End If
```

C# Example

```
if (! myReader.IsDBNull(myReader.GetOrdinal("mytime")))
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"));
else
    myTime = DateTime.MinValue;
```

`NULL` values will work in a dataset and can be bound to form controls without special handling.

25.2.6. Connector/NET Support

The developers of Connector/NET greatly value the input of our users in the software development process. If you find Connector/NET lacking some feature important to you, or if you discover a bug and need to file a bug report, please use the instructions in [Section 1.8, "How to Report Bugs or Problems"](#).

25.2.6.1. Connector/NET Community Support

- Community support for Connector/NET can be found through the forums at <http://forums.mysql.com>.
- Community support for Connector/NET can also be found through the mailing lists at <http://lists.mysql.com>.
- Paid support is available from MySQL AB. Additional information is available at <http://www.mysql.com/support/>.

25.2.6.2. How to report Connector/NET Problems or Bugs

If you encounter difficulties or problems with Connector/NET, contact the Connector/NET community [Section 25.2.6.1, “Connector/NET Community Support”](#).

You should first try to execute the same SQL statements and commands from the `mysql` client program or from `admn demo`. This helps you determine whether the error is in Connector/NET or MySQL.

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/NET version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

25.2.6.3. Connector/NET Change History

The Connector/NET Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.3, “MySQL Connector/NET Change History”](#).

25.3. MySQL Connector/J

MySQL provides connectivity for client applications developed in the Java programming language via a JDBC driver, which is called MySQL Connector/J.

MySQL Connector/J is a JDBC-3.0 Type 4 driver, which means that is pure Java, implements version 3.0 of the JDBC specification, and communicates directly with the MySQL server using the MySQL protocol.

Although JDBC is useful by itself, we would hope that if you are not familiar with JDBC that after reading the first few sections of this manual, that you would avoid using naked JDBC for all but the most trivial problems and consider using one of the popular persistence frameworks such as [Hibernate](http://www.hibernate.org/) [http://www.hibernate.org/], [Spring's JDBC templates](http://www.springframework.org/) [http://www.springframework.org/] or [Ibatis SQL Maps](http://ibatis.apache.org/) [http://ibatis.apache.org/] to do the majority of repetitive work and heavier lifting that is sometimes required with JDBC.

This section is not designed to be a complete JDBC tutorial. If you need more information about using JDBC you might be interested in the following online tutorials that are more in-depth than the information presented here:

- [JDBC Basics](http://java.sun.com/docs/books/tutorial/jdbc/basics/index.html) [http://java.sun.com/docs/books/tutorial/jdbc/basics/index.html] — A tutorial from Sun covering beginner topics in JDBC
- [JDBC Short Course](http://java.sun.com/developer/onlineTraining/Database/JDBCShortCourse/index.html) [http://java.sun.com/developer/onlineTraining/Database/JDBCShortCourse/index.html] — A more in-depth tutorial from Sun and JGuru

25.3.1. Connector/J Versions

There are currently three version of MySQL Connector/J available:

- Connector/J 3.0 provides core functionality and was designed with connectivity to MySQL 3.x or MySQL 4.1 servers, although it will provide basic compatibility with later versions of MySQL. Connector/J 3.0 does not support server-side prepared statements, and does not support any of the features in versions of MySQL later than 4.1.
- Connector/J 3.1 was designed for connectivity to MySQL 4.1 and MySQL 5.0 servers and provides support for all the functionality in MySQL 5.0 except distributed transaction (XA) support.
- Connector/J 5.0 provides support for all the functionality offered by Connector/J 3.1 and includes distributed transaction (XA) support.

The current recommended version for Connector/J is 5.0. This guide covers all three connector versions, with specific notes given where a setting applies to a specific option.

25.3.1.1. Java Versions Supported

MySQL Connector/J supports Java-2 JVMs, including:

- JDK 1.2.x (only for Connector/J 3.1.x or earlier)
- JDK 1.3.x
- JDK 1.4.x
- JDK 1.5.x

If you are building Connector/J from source using the source distribution (see [Section 25.3.2.4, “Installing from the Development Source Tree”](#)) then you must use JDK 1.4.x or newer to compile the Connector package.

MySQL Connector/J does not support JDK-1.1.x or JDK-1.0.x.

Because of the implementation of `java.sql.Savepoint`, Connector/J 3.1.0 and newer will not run on JDKs older than 1.4 unless the class verifier is turned off (by setting the `-Xverify:none` option to the Java runtime). This is because the class verifier will try to load the class definition for `java.sql.Savepoint` even though it is not accessed by the driver unless you actually use savepoint functionality.

Caching functionality provided by Connector/J 3.1.0 or newer is also not available on JVMs older than 1.4.x, as it relies on `java.util.LinkedHashMap` which was first available in JDK-1.4.0.

25.3.2. Installing Connector/J

You can install the Connector/J package using two methods, using either the binary or source distribution. The binary distribution provides the easiest methods for installation; the source distribution enables you to customize your installation further. With either solution, you must

25.3.2.1. Installing Connector/J from a Binary Distribution

The easiest method of installation is to use the binary distribution of the Connector/J package. The binary distribution is available either as a Tar/Gzip or Zip file which you must extract to a suitable location and then optionally make the information about the package available by changing your `CLASSPATH` (see [Section 25.3.2.2, “Installing the Driver and Configuring the CLASSPATH”](#)).

MySQL Connector/J is distributed as a `.zip` or `.tar.gz` archive containing the sources, the class files, and the JAR archive named `mysql-connector-java-[version]-bin.jar`, and starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar`.

Starting with Connector/J 3.1.9, the `.class` files that constitute the JAR files are only included as part of the driver JAR file.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

You will need to use the appropriate graphical or command-line utility to un-archive the distribution (for example, WinZip for the `.zip` archive, and `tar` for the `.tar.gz` archive). Because there are potentially long filenames in the distribution, we use the GNU tar archive format. You will need to use GNU tar (or an application that understands the GNU tar archive format) to unpack the `.tar.gz` variant of the distribution.

25.3.2.2. Installing the Driver and Configuring the CLASSPATH

Once you have extracted the distribution archive, you can install the driver by placing `mysql-connector-java-[version]-bin.jar` in your classpath, either by adding the full path to it to your `CLASSPATH` environment variable, or by directly specifying it with the command line switch `-cp` when starting your JVM.

If you are going to use the driver with the JDBC DriverManager, you would use `com.mysql.jdbc.Driver` as the class that implements `java.sql.Driver`.

You can set the `CLASSPATH` environment variable under UNIX, Linux or Mac OS X either locally for a user within their `.profile`, `.login` or other login file. You can also set it globally by editing the global `/etc/profile` file.

For example, under a C shell (`csh`, `tcsh`) you would add the Connector/J driver to your `CLASSPATH` using the following:

```
shell> setenv CLASSPATH /path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Or with a Bourne-compatible shell (`sh`, `ksh`, `bash`):

```
export set CLASSPATH=/path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Within Windows 2000, Windows XP and Windows Server 2003, you must set the environment variable through the System control panel.

If you want to use MySQL Connector/J with an application server such as Tomcat or JBoss, you will have to read your vendor's documentation for more information on how to configure third-party class libraries, as most application servers ignore the `CLASSPATH` environment variable. For configuration examples for some J2EE application servers, see [Section 25.3.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#). However, the authoritative source for JDBC connection pool configuration information for your particular application server is the documentation for that application server.

If you are developing servlets or JSPs, and your application server is J2EE-compliant, you can put the driver's .jar file in the `WEB-INF/lib` subdirectory of your webapp, as this is a standard location for third party class libraries in J2EE web applications.

You can also use the `MysqlDataSource` or `MysqlConnectionPoolDataSource` classes in the `com.mysql.jdbc.jdbc2.optional` package, if your J2EE application server supports or requires them. Starting with Connector/J 5.0.0, the `javax.sql.XADataSource` interface is implemented via the `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` class, which supports XA distributed transactions when used in combination with MySQL server version 5.0.

The various `MysqlDataSource` classes support the following parameters (through standard set mutators):

- user
- password
- serverName (see the previous section about fail-over hosts)
- databaseName
- port

25.3.2.3. Upgrading from an Older Version

MySQL AB tries to keep the upgrade process as easy as possible, however as is the case with any software, sometimes changes need to be made in new versions to support new features, improve existing functionality, or comply with new standards.

This section has information about what users who are upgrading from one version of Connector/J to another (or to a new version of the MySQL server, with respect to JDBC functionality) should be aware of.

25.3.2.3.1. Upgrading from MySQL Connector/J 3.0 to 3.1

Connector/J 3.1 is designed to be backward-compatible with Connector/J 3.0 as much as possible. Major changes are isolated to new functionality exposed in MySQL-4.1 and newer, which includes Unicode character sets, server-side prepared statements, `SQLState` codes returned in error messages by the server and various performance enhancements that can be enabled or disabled via configuration properties.

- **Unicode Character Sets** — See the next section, as well as [Chapter 10, *Character Set Support*](#), for information on this new feature of MySQL. If you have something misconfigured, it will usually show up as an error with a message similar to `Illegal mix of collations`.
- **Server-side Prepared Statements** — Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer).

Starting with version 3.1.7, the driver scans SQL you are preparing via all variants of `Connec-`

`tion.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this feature by passing `emulateUnsupportedPstmts=false` in your JDBC URL.

If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the connection property `useServerPrepStmts=false`

- **Datetimes** with all-zero components (`0000-00-00 ...`) — These values can not be represented reliably in Java. Connector/J 3.0.x always converted them to NULL when being read from a Result-Set.

Connector/J 3.1 throws an exception by default when these values are encountered as this is the most correct behavior according to the JDBC and SQL standards. This behavior can be modified using the `zeroDateTimeBehavior` configuration property. The allowable values are:

- `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`.
- `convertToNull`, which returns `NULL` instead of the date.
- `round`, which rounds the date to the nearest closest value which is `0001-01-01`.

Starting with Connector/J 3.1.7, `ResultSet.getString()` can be decoupled from this behavior via `noDatetimeStringSync=true` (the default value is `false`) so that you can get retrieve the unaltered all-zero value as a `String`. It should be noted that this also precludes using any time zone conversions, therefore the driver will not allow you to enable `noDatetimeStringSync` and `useTimezone` at the same time.

- **New SQLState Codes** — Connector/J 3.1 uses SQL:1999 SQLState codes returned by the MySQL server (if supported), which are different from the legacy X/Open state codes that Connector/J 3.0 uses. If connected to a MySQL server older than MySQL-4.1.0 (the oldest version to return SQLStates as part of the error code), the driver will use a built-in mapping. You can revert to the old mapping by using the configuration property `useSqlStateCodes=false`.
- **ResultSet.getString()** — Calling `ResultSet.getString()` on a BLOB column will now return the address of the `byte[]` array that represents it, instead of a `String` representation of the BLOB. BLOBs have no character set, so they can't be converted to `java.lang.Strings` without data loss or corruption.

To store strings in MySQL with LOB behavior, use one of the TEXT types, which the driver will treat as a `java.sql.Clob`.

- **Debug builds** — Starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar` is shipped alongside the normal binary jar file that is named `mysql-connector-java-[version]-bin.jar`.

Starting with Connector/J 3.1.9, we don't ship the `.class` files unbundled, they are only available in the JAR archives that ship with the driver.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

25.3.2.3.2. JDBC-Specific Issues When Upgrading to MySQL Server 4.1 or Newer

- *Using the UTF-8 Character Encoding* - Prior to MySQL server version 4.1, the UTF-8 character encoding was not supported by the server, however the JDBC driver could use it, allowing storage of multiple character sets in latin1 tables on the server.

Starting with MySQL-4.1, this functionality is deprecated. If you have applications that rely on this functionality, and can not upgrade them to use the official Unicode character support in MySQL server version 4.1 or newer, you should add the following property to your connection URL:

```
useOldUTF8Behavior=true
```

- *Server-side Prepared Statements* - Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer). If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the following connection property:

```
useServerPrepStmts=false
```

25.3.2.4. Installing from the Development Source Tree

Caution. You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/J up and running on your system, you should use a standard release distribution.

To install MySQL Connector/J from the development source tree, make sure that you have the following prerequisites:

- Subversion, to check out the sources from our repository (available from <http://subversion.tigris.org/>).
- Apache Ant version 1.6 or newer (available from <http://ant.apache.org/>).
- JDK-1.4.2 or later. Although MySQL Connector/J can be installed on older JDKs, to compile it from source you must have at least JDK-1.4.2.

The Subversion source code repository for MySQL Connector/J is located at <http://svn.mysql.com/svnpublic/connector-j>. In general, you should not check out the entire repository because it contains every branch and tag for MySQL Connector/J and is quite large.

To check out and compile a specific branch of MySQL Connector/J, follow these steps:

1. At the time of this writing, there are three active branches of Connector/J: `branch_3_0`, `branch_3_1` and `branch_5_0`. Check out the latest code from the branch that you want with the following command (replacing `[major]` and `[minor]` with appropriate version numbers):

```
shell> svn co »  
http://svn.mysql.com/svnpublic/connector-j/branches/branch\_\[major\]\_\[minor\]/connector-j
```

This creates a `connector-j` subdirectory in the current directory that contains the latest sources for the requested branch.

2. Change location to the `connector-j` directory to make it your current working directory:

```
shell> cd connector-j
```

3. Issue the following command to compile the driver and create a `.jar` file suitable for installation:

```
shell> ant dist
```

This creates a `build` directory in the current directory, where all build output will go. A directory is created in the `build` directory that includes the version number of the sources you are building from. This directory contains the sources, compiled `.class` files, and a `.jar` file suitable for deployment. For other possible targets, including ones that will create a fully packaged distribution, issue the following command:

```
shell> ant --projecthelp
```

4. A newly created `.jar` file containing the JDBC driver will be placed in the directory `build/mysql-connector-java-[version]`.

Install the newly created JDBC driver as you would a binary `.jar` file that you download from MySQL by following the instructions in [Section 25.3.2.2, “Installing the Driver and Configuring the CLASSPATH”](#).

25.3.3. Connector/J Examples

Examples of using Connector/J are located throughout this document, this section provides a summary and links to these examples.

- [Example 25.1, “Obtaining a connection from the DriverManager”](#)
- [Example 25.2, “Using java.sql.Statement to execute a SELECT query”](#)
- [Example 25.3, “Stored Procedures”](#)
- [Example 25.4, “Using Connection.prepareStatement\(\)”](#)
- [Example 25.5, “Registering output parameters”](#)
- [Example 25.6, “Setting CallableStatement input parameters”](#)
- [Example 25.7, “Retrieving results and output parameter values”](#)
- [Example 25.8, “Retrieving AUTO_INCREMENT column values using Statement.getGeneratedKeys\(\)”](#)
- [Example 25.9, “Retrieving AUTO_INCREMENT column values using SELECT LAST_INSERT_ID\(\)”](#)
- [Example 25.10, “Retrieving AUTO_INCREMENT column values in Updatable ResultSets”](#)
- [Example 25.11, “Using a connection pool with a J2EE application server”](#)
- [Example 25.12, “Example of transaction with retry logic”](#)

25.3.4. Connector/J (JDBC) Reference

This section of the manual contains reference material for MySQL Connector/J, some of which is automatically generated during the Connector/J build process.

25.3.4.1. Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J

The name of the class that implements `java.sql.Driver` in MySQL Connector/J is `com.mysql.jdbc.Driver`. The `org.gjt.mm.mysql.Driver` class name is also usable to remain backward-compatible with MM.MySQL. You should use this class name when registering the driver, or when otherwise configuring software to use MySQL Connector/J.

The JDBC URL format for MySQL Connector/J is as follows, with items in square brackets ([,]) being optional:

```
jdbc:mysql://[host][,failoverhost...][:port]/[database] »
[?propertyName1[=propertyValue1][&propertyName2[=propertyValue2]...
```

If the hostname is not specified, it defaults to 127.0.0.1. If the port is not specified, it defaults to 3306, the default port number for MySQL servers.

```
jdbc:mysql://[host:port],[host:port].../[database] »
[?propertyName1[=propertyValue1][&propertyName2[=propertyValue2]...
```

If the database is not specified, the connection will be made with no default database. In this case, you will need to either call the `setCatalog()` method on the `Connection` instance or fully-specify table names using the database name (i.e. `SELECT dbname.tablename.colname FROM dbname.tablename...`) in your SQL. Not specifying the database to use upon connection is generally only useful when building tools that work with multiple databases, such as GUI database managers.

MySQL Connector/J has fail-over support. This allows the driver to fail-over to any number of slave hosts and still perform read-only queries. Fail-over only happens when the connection is in an `autoCommit(true)` state, because fail-over can not happen reliably when a transaction is in progress. Most application servers and connection pools set `autoCommit` to `true` at the end of every transaction/connection use.

The fail-over functionality has the following behavior:

- If the URL property `autoReconnect` is `false`: Failover only happens at connection initialization, and failback occurs when the driver determines that the first host has become available again.
- If the URL property `autoReconnect` is `true`: Failover happens when the driver determines that the connection has failed (before *every* query), and falls back to the first host when it determines that the host has become available again (after `queriesBeforeRetryMaster` queries have been issued).

In either case, whenever you are connected to a "failed-over" server, the connection will be set to read-only state, so queries that would modify data will have exceptions thrown (the query will **never** be processed by the MySQL server).

Configuration properties define how Connector/J will make a connection to a MySQL server. Unless otherwise noted, properties can be set for a `DataSource` object or for a `Connection` object.

Configuration Properties can be set in one of the following ways:

- Using the `set*()` methods on MySQL implementations of `java.sql.DataSource` (which is the preferred method when using implementations of `java.sql.DataSource`):
 - `com.mysql.jdbc.jdbc2.optional.MysqlDataSource`

- `com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource`
- As a key/value pair in the `java.util.Properties` instance passed to `DriverManager.getConnection()` or `Driver.connect()`
- As a JDBC URL parameter in the URL given to `java.sql.DriverManager.getConnection()`, `java.sql.Driver.connect()` or the MySQL implementations of the `javax.sql.DataSource.setURL()` method.

Note. If the mechanism you use to configure a JDBC URL is XML-based, you will need to use the XML character literal `&#amp;`; to separate configuration parameters, as the ampersand is a reserved character for XML.

The properties are listed in the following tables.

Connection/Authentication.

Property Name	Definition	Default Value	Since Version
<code>user</code>	The user to connect as		all
<code>password</code>	The password to use when connecting		all
<code>socketFactory</code>	The name of the class that the driver should use for creating socket connections to the server. This class must implement the interface <code>com.mysql.jdbc.SocketFactory</code> and have public no-args constructor.	<code>com.mysql.jdbc.StandardSocketFactory</code>	3.0.3
<code>connectTimeout</code>	Timeout for socket connect (in milliseconds), with 0 being no timeout. Only works on JDK-1.4 or newer. Defaults to 0.	0	3.0.1
<code>socketTimeout</code>	Timeout on network socket operations (0, the default means no timeout).	0	3.0.1
<code>useConfigs</code>	Load the comma-delimited list of configuration properties before parsing the URL or applying user-specified properties. See Section 25.3.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”		3.1.5
<code>interactiveClient</code>	Set the <code>CLIENT_INTERACTIVE</code> flag, which tells MySQL to timeout connections based on <code>INTERACTIVE_TIMEOUT</code> instead of <code>WAIT_TIMEOUT</code>	false	3.1.0
<code>propertiesTransform</code>	An implementation of <code>com.mysql.jdbc.ConnectionPropertiesTransform</code> that the driver will use to modify URL properties passed to the driver before attempting a connection		3.1.4
<code>useCompression</code>	Use zlib compression when communicating with the server (true/false)? Defaults to <code>false</code> .	false	3.0.17

High Availability and Clustering.

Property Name	Definition	Default	Since
---------------	------------	---------	-------

		Value	Version
autoReconnect	Should the driver try to re-establish stale and/or dead connections? If enabled the driver will throw an exception for a queries issued on a stale or dead connection, which belong to the current transaction, but will attempt reconnect before the next query issued on the connection in a new transaction. The use of this feature is not recommended, because it has side effects related to session state and data consistency when applications don'thandle SQLExceptions properly, and is only designed to be used when you are unable to configure your application to handle SQLExceptions resulting from dead andstale connections properly. Alternatively, investigate setting the MySQL server variable "wait_timeout"to some high value rather than the default of 8 hours.	false	1.1
autoReconnectForPools	Use a reconnection strategy appropriate for connection pools (defaults to 'false')	false	3.1.3
failOverReadOnly	When failing over in autoReconnect mode, should the connection be set to 'read-only'?	true	3.0.12
reconnectAtTxEnd	If autoReconnect is set to true, should the driver attempt reconnections at the end of every transaction?	false	3.0.10
roundRobinLoadBalance	When autoReconnect is enabled, and failover-ReadOnly is false, should we pick hosts to connect to on a round-robin basis?	false	3.1.2
queriesBeforeRetryMaster	Number of queries to issue before falling back to master when failed over (when using multi-host failover). Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Defaults to 50.	50	3.0.2
secondsBeforeRetryMaster	How long should the driver wait, when failed over, before attempting to reconnect to the master server? Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Time in seconds, defaults to 30	30	3.0.2
resourceId	A globally unique name that identifies the resource that this datasource or connection is connected to, used for <code>XAResource.isSameRM()</code> when the driver can't determine this value based on host-names used in the URL		5.0.1

Security.

Property Name	Definition	Default Value	Since Version
allowMultiQueries	Allow the use of ';' to delimit multiple queries during one statement (true/false, defaults to 'false')	false	3.1.1
useSSL	Use SSL when communicating with the server	false	3.0.2

	(true/false), defaults to 'false'		
requireSSL	Require SSL connection if useSSL=true? (defaults to 'false').	false	3.1.0
allowUrlInLocalInfile	Should the driver allow URLs in 'LOAD DATA LOCAL INFILE' statements?	false	3.1.4
paranoid	Take measures to prevent exposure sensitive information in error messages and clear data structures holding sensitive data when possible? (defaults to 'false')	false	3.0.1

Performance Extensions.

Property Name	Definition	Default Value	Since Version
metadataCacheSize	The number of queries to cacheResultSetMetadata for if cacheResultSetMetaData is set to 'true' (default 50)	50	3.1.1
prepStmtCacheSize	If prepared statement caching is enabled, how many prepared statements should be cached?	25	3.0.10
prepStmtCacheSqlLimit	If prepared statement caching is enabled, what's the largest SQL the driver will cache the parsing for?	256	3.0.10
useCursorFetch	If connected to MySQL > 5.0.2, and <code>setFetchSize()</code> > 0 on a statement, should that statement use cursor-based fetching to retrieve rows?	false	5.0.0
blobSendChunkSize	Chunk to use when sending BLOB/CLOBs via ServerPreparedStatements	1048576	3.1.9
cacheCallableStmts	Should the driver cache the parsing stage of CallableStatements	false	3.1.2
cachePrepStmts	Should the driver cache the parsing stage of PreparedStatements of client-side prepared statements, the check for suitability of server-side prepared and server-side prepared statements themselves?	false	3.0.10
cacheResultSetMetadata	Should the driver cache ResultSetMetaData for Statements and PreparedStatements? (Req. JDK-1.4+, true/false, default 'false')	false	3.1.1
cacheServerConfiguration	Should the driver cache the results of <code>SHOW VARIABLES</code> and <code>SHOW COLLATION</code> on a per-URL basis?	false	3.1.5
defaultFetchSize	The driver will call <code>setFetchSize(n)</code> with this value on all newly-created Statements	0	3.1.9
dontTrackOpenResources	The JDBC specification requires the driver to automatically track and close resources, however if your application doesn't do a good job of explicitly calling <code>close()</code> on statements or result sets, this can cause memory leakage. Setting this property to true relaxes this constraint, and can be more memory efficient for some applications.	false	3.1.7
dynamicCalendars	Should the driver retrieve the default calendar	false	3.1.5

	when required, or cache it per connection/session?		
elideSetAutoCommits	If using MySQL-4.1 or newer, should the driver only issue 'set autocommit=n' queries when the server's state doesn't match the requested state by <code>Connection.setAutoCommit(boolean)</code> ?	false	3.1.3
holdResultsOpenOverStatementClose	Should the driver close result sets on <code>Statement.close()</code> as required by the JDBC specification?	false	3.1.7
locatorFetchBufferSize	If 'emulateLocators' is configured to 'true', what size buffer should be used when fetching BLOB data for <code>getBinaryInputStream</code> ?	1048576	3.2.1
rewriteBatchedStatements	Should the driver use multiqueries (irregardless of the setting of <code>allowMultiQueries</code>) as well as rewriting of prepared statements for <code>INSERT</code> into multi-value inserts when <code>executeBatch()</code> is called? Notice that this has the potential for SQL injection if using plain <code>java.sql.Statements</code> and your code doesn't sanitize input correctly. Notice that for prepared statements, server-side prepared statements can not currently take advantage of this rewrite option, and that if you don't specify stream lengths when using <code>PreparedStatement.set*Stream()</code> , the driver won't be able to determine the optimum number of parameters per batch and you might receive an error from the driver that the resultant packet is too large. <code>Statement.getGeneratedKeys()</code> for these rewritten statements only works when the entire batch includes <code>INSERT</code> statements.	false	3.1.13
useFastIntParsing	Use internal String->Integer conversion routines to avoid excessive object creation?	true	3.1.4
useJvmCharsetConverters	Always use the character encoding routines built into the JVM, rather than using lookup tables for single-byte character sets? (The default of "true" for this is appropriate for newer JVMs)	true	5.0.1
useLocalSessionState	Should the driver refer to the internal values of autocommit and transaction isolation that are set by <code>Connection.setAutoCommit()</code> and <code>Connection.setTransactionIsolation()</code> , rather than querying the database?	false	3.1.7
useReadAheadInput	Use newer, optimized non-blocking, buffered input stream when reading from the server?	true	3.1.5

Debugging/Profiling.

Property Name	Definition	Default Value	Since Version
logger	The name of a class that implements 'com.mysql.jdbc.log.Log' that will be used to log messages to. (default is 'com.mysql.jdbc.log.StandardLogger', which logs to <code>STDERR</code>)	com.mysql.jdbc.log.StandardLogger	3.1.1
profileSQL	Trace queries and their execution/fetch times to the	false	3.1.0

	configured logger (true/false) defaults to 'false'		
reportMetricsIntervalMillis	If 'gatherPerfMetrics' is enabled, how often should they be logged (in ms)?	30000	3.1.2
maxQuerySizeToLog	Controls the maximum length/size of a query that will get logged when profiling or tracing	2048	3.1.3
packetDebugBufferSize	The maximum number of packets to retain when 'enablePacketDebug' is true	20	3.1.3
slowQueryThresholdMillis	If 'logSlowQueries' is enabled, how long should a query (in ms) before it is logged as 'slow'?	2000	3.1.2
useUsageAdvisor	Should the driver issue 'usage' warnings advising proper and efficient usage of JDBC and MySQL Connector/J to the log (true/false, defaults to 'false')?	false	3.1.1
autoGenerateTestcaseScript	Should the driver dump the SQL it is executing, including server-side prepared statements to STDERR?	false	3.1.9
dumpMetadataOnColumnNotFound	Should the driver dump the field-level metadata of a result set into the exception message when ResultSet.findColumn() fails?	false	3.1.13
dumpQueriesOnException	Should the driver dump the contents of the query sent to the server in the message for SQLExceptions?	false	3.1.3
enablePacketDebug	When enabled, a ring-buffer of 'packetDebugBufferSize' packets will be kept, and dumped when exceptions are thrown in key areas in the driver's code	false	3.1.3
explainSlowQueries	If 'logSlowQueries' is enabled, should the driver automatically issue an 'EXPLAIN' on the server and send the results to the configured log at a WARN level?	false	3.1.2
logSlowQueries	Should queries that take longer than 'slowQueryThresholdMillis' be logged?	false	3.1.2
traceProtocol	Should trace-level network protocol be logged?	false	3.1.2

Miscellaneous.

Property Name	Definition	Default Value	Since Version
useUnicode	Should the driver use Unicode character encodings when handling strings? Should only be used when the driver can't determine the character set mapping, or you are trying to 'force' the driver to use a character set that MySQL either doesn't natively support (such as UTF-8), true/false, defaults to 'true'	true	1.1g
characterEncoding	If 'useUnicode' is set to true, what character encoding should the driver use when dealing with strings? (defaults is to 'autodetect')		1.1g
characterSetResults	Character set to tell the server to return results as.		3.0.13
connectionCollation	If set, tells the server to use this collation via 'set'		3.0.13

	collation_connection'		
sessionVariables	A comma-separated list of name/value pairs to be sent as SET SESSION ... to the server when the driver connects.		3.1.8
allowNanAndInf	Should the driver allow NaN or +/- INF values in PreparedStatement.setDouble()?	false	3.1.5
autoClosePstmtStreams	Should the driver automatically call .close() on streams/readers passed as arguments via set*() methods?	false	3.1.12
autoDeserialize	Should the driver automatically detect and de-serialize objects stored in BLOB fields?	false	3.1.5
capitalizeTypeNames	Capitalize type names in DatabaseMetaData? (usually only useful when using WebObjects, true/false, defaults to 'false')	false	2.0.7
clobCharacterEncoding	The character encoding to use for sending and retrieving TEXT, MEDIUMTEXT and LONGTEXT values instead of the configured connection characterEncoding		5.0.0
clobberStreamingResults	This will cause a 'streaming' ResultSet to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.	false	3.0.9
continueBatchOnError	Should the driver continue processing batch commands if one statement fails. The JDBC spec allows either way (defaults to 'true').	true	3.0.3
createDatabaseIfNotExist	Creates the database given in the URL if it doesn't yet exist. Assumes the configured user has permissions to create databases.	false	3.1.9
emptyStringsConvertToZero	Should the driver allow conversions from empty string fields to numeric values of '0'?	true	3.1.8
emulateLocators	N/A	false	3.1.0
emulateUnsupportedPstmts	Should the driver detect prepared statements that are not supported by the server, and replace them with client-side emulated versions?	true	3.1.7
ignoreNonTxTables	Ignore non-transactional table warning for roll-back? (defaults to 'false').	false	3.0.9
jdbcCompliantTruncation	Should the driver throw java.sql.DataTruncation exceptions when data is truncated as is required by the JDBC specification when connected to a server that supports warnings(MySQL 4.1.0 and newer)?	true	3.1.2
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions
noAccessToProcedureBodies	When determining procedure parameter types for CallableStatements, and the connected user can't access procedure bodies through "SHOW CREATE PROCEDURE" or select on mysql.proc should the driver instead create basic metadata (all parameters reported as INOUT VARCHARs) instead of throwing an exception?	false	5.0.3
noDatetimeStringSync	Don't ensure that Result-	false	3.1.7

	<code>Set.getDatetimeType().toString().equals(ResultSet.getString())</code>		
<code>noTimezoneConversionForTimeType</code>	Don't convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
<code>nullCatalogMeansCurrent</code>	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? (this is not JDBC-compliant, but follows legacy behavior from earlier versions of the driver)	true	3.1.8
<code>nullNamePatternMatchesAll</code>	Should DatabaseMetaData methods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
<code>overrideSupportsIntegrityEnhancementFacility</code>	Should the driver return "true" for DatabaseMetaData.supportsIntegrityEnhancementFacility() even if the database doesn't support it to work-around applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
<code>pedantic</code>	Follow the JDBC spec to the letter.	false	3.0.0
<code>pinGlobalTxToPhysicalConnection</code>	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
<code>processEscapeCodesForPrepStmts</code>	Should the driver process escape codes in queries that are prepared?	true	3.1.12
<code>relaxAutoCommit</code>	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
<code>retainStatementAfterResultSetClose</code>	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
<code>rollbackOnPooledClose</code>	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15
<code>runningCTS13</code>	Enables workarounds for bugs in Sun's JDBC compliance testsuite version 1.3	false	3.1.7
<code>serverTimezone</code>	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2
<code>strictFloatingPoint</code>	Used only in older versions of compliance test	false	3.0.0
<code>strictUpdates</code>	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
<code>tinyInt1isBit</code>	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16

transformedBitIsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for _all_ statements? (true/false, defaults to 'false')	false	2.0.3
useGmtMillisForDatetimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior.	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in DatabaseMetaData.getColumn/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliant-TimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "use-Timezone=true" configuration option.)	false	5.0.0
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Don't prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useServerPrepStmts	Use server-side prepared statements if the server supports them? (defaults to 'true').	true	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL state codes (true/false), default is 'true'	true	3.1.3
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2
useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2
useUnbufferedInput	Don't use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeroes (used by MySQL to represent invalid dates)? Valid values are 'exception', 'round' and 'convertToNull'.	exception	3.1.4

Connector/J also supports access to MySQL via named pipes on Windows NT/2000/XP using the NamedPipeSocketFactory as a plugin-socket factory via the socketFactory property. If you don't use a namedPipePath property, the default of '\\.\pipe\MySQL' will be used. If you use the [Named-](#)

`PipeSocketFactory`, the hostname and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access.

You can create your own socket factories by following the example code in `com.mysql.jdbc.NamedPipeSocketFactory`, or `com.mysql.jdbc.StandardSocketFactory`.

25.3.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly-available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification allows leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- Blob

The Blob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the corresponding `PreparedStatement.setBlob()` or `ResultSet.updateBlob()` (in the case of updatable result sets) methods to save changes back to the database.

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property 'emulateLocators=true' to your JDBC URL. You must then use a column alias with the value of the column set to the actual name of the Blob column in the `SELECT` that you write to retrieve the Blob. The `SELECT` must also reference only one table, the table must have a primary key, and the `SELECT` must cover all columns that make up the primary key. The driver will then delay loading the actual Blob data until you retrieve the Blob and call retrieval methods (`getInputStream()`, `getBytes()`, and so forth) on it.

- CallableStatement

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer via the `CallableStatement` interface. Currently, the `getParameterMetaData()` method of `CallableStatement` is not supported.

- Clob

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setClob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- Connection

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is alive. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- DatabaseMetaData

Foreign Key information (`getImportedKeys()`/`getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- PreparedStatement

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set via `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a non-large parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- The driver streams the large data out-of-band to the prepared statement on the server side when the parameter is set (before execution of the prepared statement).
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and can't be read from again.
- If a parameter changes from large to non-large, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, via the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` methods.

Consequently, if you want to change the type of a parameter to a non-large one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- ResultSet

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement( java.sql.ResultSet.TYPE_FORWARD_ONLY,
                             java.sql.ResultSet.CONCUR_READ_ONLY );
stmt.setFetchSize( Integer.MIN_VALUE );
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can issue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be [MyISAM](#) table-level locks or row-level locks in some other storage engine such as [InnoDB](#)) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- `ResultSetMetaData`

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- `Statement`

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so `setCursorName()` has no effect.

25.3.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numerical type can be converted to any of the Java numerical types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

Connection Properties - Miscellaneous.

These MySQL Data Types	Can always be converted to these Java types
<code>CHAR</code> , <code>VARCHAR</code> , <code>BLOB</code> , <code>TEXT</code> , <code>ENUM</code> , and <code>SET</code>	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> , <code>java.sql.Clob</code>
<code>FLOAT</code> , <code>REAL</code> , <code>DOUBLE PRECISION</code> , <code>NUMERIC</code> , <code>DECIMAL</code> , <code>TINYINT</code> , <code>SMALLINT</code> , <code>MEDIUMINT</code> , <code>INTEGER</code> , <code>BIGINT</code>	<code>java.lang.String</code> , <code>java.lang.Short</code> , <code>java.lang.Integer</code> , <code>java.lang.Long</code> , <code>java.lang.Double</code> , <code>java.math.BigDecimal</code>
<code>DATE</code> , <code>TIME</code> , <code>DATETIME</code> , <code>TIMESTAMP</code>	<code>java.lang.String</code> , <code>java.sql.Date</code> , <code>java.sql.Timestamp</code>

Note: round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSetMetaData.getColumnClassName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](http://java.sun.com/j2se/1.4.2/docs/api/java/sql/Types.html) [http://java.sun.com/j2se/1.4.2/docs/api/java/sql/Types.html].

MySQL Types to Java Types for `ResultSet.getObject()`.

MySQL Type Name	Return value of <code>Get-ColumnClassName</code>	Returned as Java Class
BIT(1) (new in MySQL-5.0)	BIT	<code>java.lang.Boolean</code>
BIT(> 1) (new in MySQL-5.0)	BIT	<code>byte[]</code>
TINYINT	TINYINT	<code>java.lang.Boolean</code> if the configuration property <code>tinyIntIsBit</code> is set to <code>true</code> (the default) and the storage size is 1, or <code>java.lang.Integer</code> if not.
BOOL, BOOLEAN	TINYINT	See TINYINT, above as these are aliases for TINYINT(1), currently.
SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]	<code>java.lang.Integer</code> (regardless if UNSIGNED or not)
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
INT,INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]	<code>java.lang.Long</code> , if UNSIGNED <code>java.math.BigInteger</code>
FLOAT[(M,D)]	FLOAT	<code>java.lang.Float</code>
DOUBLE[(M,B)]	DOUBLE	<code>java.lang.Double</code>
DECIMAL[(M[,D])]	DECIMAL	<code>java.math.BigDecimal</code>
DATE	DATE	<code>java.sql.Date</code>
DATETIME	DATETIME	<code>java.sql.Timestamp</code>
TIMESTAMP[(M)]	TIMESTAMP	<code>java.sql.Timestamp</code>
TIME	TIME	<code>java.sql.Time</code>
YEAR[(2 4)]	YEAR	If <code>yearIsDateType</code> configuration property is set to false, then the returned object type is <code>java.sql.Short</code> . If set to true (the default) then an object of type <code>java.sql.Date</code> (with the date set to January 1st, at midnight).
CHAR(M)	CHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
VARCHAR(M) [BINARY]	VARCHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
BINARY(M)	BINARY	<code>byte[]</code>

VARBINARY(M)	VARBINARY	byte[]
TINYBLOB	TINYBLOB	byte[]
TINYTEXT	VARCHAR	java.lang.String
BLOB	BLOB	byte[]
TEXT	VARCHAR	java.lang.String
MEDIUMBLOB	MEDIUMBLOB	byte[]
MEDIUMTEXT	VARCHAR	java.lang.String
LOB	LOB	byte[]
LONGTEXT	VARCHAR	java.lang.String
ENUM('value1','value2',...)	CHAR	java.lang.String
SET('value1','value2',...)	CHAR	java.lang.String

25.3.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client character encoding, including all queries sent via `Statement.execute()`, `Statement.executeUpdate()`, `Statement.executeQuery()` as well as all `PreparedStatement` and `CallableStatement` parameters with the exclusion of parameters set using `setBytes()`, `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()` and `setBlob()`.

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the `useUnicode` and `characterEncoding` properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in `ResultSet`.

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server via the `character_set` system variable for server versions older than 4.1.0 and `character_set_server` for server versions 4.1.0 and newer. For more information, see [Section 10.3.1, “Server Character Set and Collation”](#).

To override the automatically-detected encoding on the client side, use the `characterEncoding` property in the URL used to connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

MySQL to Java Encoding Name Translations.

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)

gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	ISO8859_1
latin2	ISO8859_2
greek	ISO8859_7
hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

Warning. Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed, and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

25.3.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The performance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.9.7, “Using Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the [SSL](#) subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server.

To use Java's `keytool` to create a truststore in the current directory, and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert \
              -file cacert.pem -keystore truststore
```

Keytool will respond with the following information:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=Walrus,
      O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=Walrus,
       O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Serial number: 0
Valid from:
  Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
  MD5: 61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
  SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You will then need to generate a client certificate, so that the MySQL server knows that it is talking to a secure client:

```
shell> keytool -genkey -keyalg rsa \
            -alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named `keystore` in the current directory.

You should respond with information that is appropriate for your situation:

```
Enter keystore password: *****
What is your first and last name?
  [Unknown]: Matthews
What is the name of your organizational unit?
  [Unknown]: Software Development
What is the name of your organization?
  [Unknown]: MySQL AB
What is the name of your City or Locality?
  [Unknown]: Flossmoor
What is the name of your State or Province?
  [Unknown]: IL
What is the two-letter country code for this unit?
  [Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
  L=Flossmoor, ST=IL, C=US> correct?
  [no]: y
Enter key password for <mysqlClientCertificate>
  (RETURN if same as keystore password):
```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property.

```
-Djavax.net.ssl.keyStore=path_to_keystore_file
-Djavax.net.ssl.keyStorePassword=*****
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=*****
```

You will also need to set `useSSL` to `true` in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to `true` in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```

JSSSE provides debugging (to STDOUT) when you set the following system property: - [Djavax.net.debug=all](#) This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

25.3.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write master, or a failover or round-robin loadbalanced set of slaves based on the state of [Connection.getReadOnly\(\)](#).

An application signals that it wants a transaction to be read-only by calling [Connection.setReadOnly\(true\)](#), this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling [Connection.setReadOnly\(false\)](#) and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of auto-commit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "[com.mysql.jdbc.ReplicationDriver](#)" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, [ReplicationDriver](#) does not currently work with [java.sql.DriverManager](#)-based connection creation unless it is the only MySQL JDBC driver registered with the [DriverManager](#).

Here is a short, simple example of how [ReplicationDriver](#) might be used in a standalone application.

```

import java.sql.Connection;
import java.sql.ResultSet;

```

```
import java.util.Properties;
import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

    public static void main(String[] args) throws Exception {
        ReplicationDriver driver = new ReplicationDriver();

        Properties props = new Properties();

        // We want this for failover on the slaves
        props.put("autoReconnect", "true");

        // We want to load balance between the slaves
        props.put("roundRobinLoadBalance", "true");

        props.put("user", "foo");
        props.put("password", "bar");

        //
        // Looks like a normal MySQL JDBC url, with a
        // comma-separated list of hosts, the first
        // being the 'master', the rest being any number
        // of slaves that the driver will load balance against
        //
        Connection conn =
            driver.connect("jdbc:mysql://master,slave1,slave2,slave3/test",
                props);

        //
        // Perform read/write work on the master
        // by setting the read-only flag to "false"
        //
        conn.setReadOnly(false);
        conn.setAutoCommit(false);
        conn.createStatement().executeUpdate("UPDATE some_table ...");
        conn.commit();

        //
        // Now, do a query from a slave, the driver automatically picks one
        // from the list
        //
        conn.setReadOnly(true);

        ResultSet rs =
            conn.createStatement().executeQuery("SELECT a,b FROM alt_table");

        .....
    }
}
```

25.3.5. Connector/J Notes and Tips

25.3.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

25.3.5.1.1. Connecting to MySQL Using the [DriverManager](#) Interface

When you are using JDBC outside of an application server, the [DriverManager](#) class manages the establishment of Connections.

The [DriverManager](#) needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use [Class.forName\(\)](#) on the class that implements the [java.sql.Driver](#) interface. With MySQL Connector/J, the name of this class is [com.mysql.jdbc.Driver](#). With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the `main()` method of your application:

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
    public static void main(String[] args) {
        try {
            // The newInstance() call is a work around for some
            // broken Java implementations

            Class.forName("com.mysql.jdbc.Driver").newInstance();
        } catch (Exception ex) {
            // handle the error
        }
    }
}
```

After the driver has been registered with the `DriverManager`, you can obtain a `Connection` instance that is connected to a particular database by calling `DriverManager.getConnection()`:

Example 25.1. Obtaining a connection from the `DriverManager`

This example shows how you can obtain a `Connection` instance from the `DriverManager`. There are a few different signatures for the `getConnection()` method. You should see the API documentation that comes with your JDK for more specific information on how to use them.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

...
try {
    Connection conn =
        DriverManager.getConnection("jdbc:mysql://localhost/test?" +
                                   "user=monty&password=greatsqldb");

    // Do something with the Connection

    ...
} catch (SQLException ex) {
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}
```

Once a `Connection` is established, it can be used to create `Statement` and `PreparedStatement` objects, as well as retrieve metadata about the database. This is explained in the following sections.

25.3.5.1.2. Using Statements to Execute SQL

`Statement` objects allow you to execute basic SQL queries and retrieve the results through the `ResultSet` class which is described later.

To create a `Statement` instance, you call the `createStatement()` method on the `Connection` object you have retrieved via one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a `Statement` instance, you can execute a `SELECT` query by calling the `ex-`

`executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows affected by the update statement.

If you don't know ahead of time whether the SQL statement will be a `SELECT` or an `UPDATE/INSERT`, then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a `SELECT`, or false if it was an `UPDATE`, `INSERT`, or `DELETE` statement. If the statement was a `SELECT` query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an `UPDATE`, `INSERT`, or `DELETE` statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the `Statement` instance.

Example 25.2. Using `java.sql.Statement` to execute a `SELECT` query

```
// assume that conn is an already created JDBC connection
Statement stmt = null;
ResultSet rs = null;

try {
    stmt = conn.createStatement();
    rs = stmt.executeQuery("SELECT foo FROM bar");

    // or alternatively, if you don't know ahead of time that
    // the query will be a SELECT...

    if (stmt.execute("SELECT foo FROM bar")) {
        rs = stmt.getResultSet();
    }

    // Now do something with the ResultSet ....
} finally {
    // it is a good idea to release
    // resources in a finally{} block
    // in reverse-order of their creation
    // if they are no-longer needed

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) { // ignore }

        rs = null;
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlEx) { // ignore }

        stmt = null;
    }
}
```

25.3.5.1.3. Using `CallableStatements` to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

See [Chapter 18, *Stored Procedures and Functions*](#), for more information on MySQL stored procedures.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

Note. Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in via `inputParam` as a `ResultSet`:

Example 25.3. Stored Procedures

```
CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), \
                        INOUT inOutParam INT)
BEGIN
  DECLARE z INT;
  SET z = inOutParam + 1;
  SET inOutParam = z;

  SELECT inputParam;

  SELECT CONCAT('zyxw', inputParam);
END
```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not optional:

Example 25.4. Using `Connection.prepareCall()`

```
import java.sql.CallableStatement;
...
//
// Prepare a call to the stored procedure 'demoSp'
// with two parameters
//
// Notice the use of JDBC-escape syntax ({call ...})
//
CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

cStmt.setString(1, "abcdefg");
```

Note. `Connection.prepareCall()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareCall()` by reusing `CallableStatement` instances in your code.

2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

Example 25.5. Registering output parameters

```
import java.sql.Types;
...
//
```

```

// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
//
//
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter(2, Types.INTEGER);
//
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...

```

3. Set the input parameters (if any exist)

Input and in/out parameters are set as for [PreparedStatement](#) objects. However, [CallableStatement](#) also supports setting parameters by name:

Example 25.6. Setting [CallableStatement](#) input parameters

```

...
//
// Set a parameter by index
//
cStmt.setString(1, "abcdefg");
//
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");
//
// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);
//
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);
...

```

4. Execute the [CallableStatement](#), and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `executeQuery()` or `execute()`), the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

Example 25.7. Retrieving results and output parameter values

```
...
    boolean hadResults = cStmt.execute();

    //
    // Process all returned result sets
    //
    while (hadResults) {
        ResultSet rs = cStmt.getResultSet();

        // process result set
        ...

        hadResults = rs.getMoreResults();
    }

    //
    // Retrieve output parameters
    //
    // Connector/J supports both index-based and
    // name-based retrieval
    //

    int outputValue = cStmt.getInt(2); // index-based
    outputValue = cStmt.getInt("inOutParam"); // name-based

    ...
```

25.3.5.1.4. Retrieving `AUTO_INCREMENT` Column Values

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

Example 25.8. Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys()`

```
Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets assuming you have a
    // Connection 'conn' to a MySQL database already
```

```

// available

stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                             java.sql.ResultSet.CONCUR_UPDATABLE);

//
// Issue the DDL queries for the table for this example
//

stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
stmt.executeUpdate(
    "CREATE TABLE autoIncTutorial ( "
    + "priKey INT NOT NULL AUTO_INCREMENT, "
    + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Insert one row that will generate an AUTO INCREMENT
// key in the 'priKey' field
//

stmt.executeUpdate(
    "INSERT INTO autoIncTutorial (dataField) "
    + "values ('Can I Get the Auto Increment Field?')",
    Statement.RETURN_GENERATED_KEYS);

//
// Example of using Statement.getGeneratedKeys()
// to retrieve the value of an auto-increment
// value
//

int autoIncKeyFromApi = -1;

rs = stmt.getGeneratedKeys();

if (rs.next()) {
    autoIncKeyFromApi = rs.getInt(1);
} else {
    // throw an exception from here
}

rs.close();

rs = null;

System.out.println("Key returned from getGeneratedKeys():"
    + autoIncKeyFromApi);
} finally {

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 25.9. Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID()`

```

Statement stmt = null;
ResultSet rs = null;

try {

```

```

//
// Create a Statement instance that we can use for
// 'normal' result sets.

stmt = conn.createStatement();

//
// Issue the DDL queries for the table for this example
//
stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
stmt.executeUpdate(
    "CREATE TABLE autoIncTutorial ("
    + "priKey INT NOT NULL AUTO_INCREMENT, "
    + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Insert one row that will generate an AUTO INCREMENT
// key in the 'priKey' field
//
stmt.executeUpdate(
    "INSERT INTO autoIncTutorial (dataField) "
    + "values ('Can I Get the Auto Increment Field?')");

//
// Use the MySQL LAST_INSERT_ID()
// function to do the same thing as getGeneratedKeys()
//
int autoIncKeyFromFunc = -1;
rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

if (rs.next()) {
    autoIncKeyFromFunc = rs.getInt(1);
} else {
    // throw an exception from here
}

rs.close();

System.out.println("Key returned from " +
    "'SELECT LAST_INSERT_ID()': " +
    autoIncKeyFromFunc);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 25.10. Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`

```

Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets as well as an 'updatable'
    // one, assuming you have a Connection 'conn' to

```

```

// a MySQL database already available
//

stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                             java.sql.ResultSet.CONCUR_UPDATABLE);

//
// Issue the DDL queries for the table for this example
//

stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
stmt.executeUpdate(
    "CREATE TABLE autoIncTutorial ( "
    + "priKey INT NOT NULL AUTO_INCREMENT, "
    + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Example of retrieving an AUTO INCREMENT key
// from an updatable result set
//

rs = stmt.executeQuery("SELECT priKey, dataField "
    + "FROM autoIncTutorial");

rs.moveToInsertRow();

rs.updateString("dataField", "AUTO INCREMENT here?");
rs.insertRow();

//
// the driver adds rows at the end
//

rs.last();

//
// We should now be on the row we just inserted
//

int autoIncKeyFromRS = rs.getInt("priKey");

rs.close();

rs = null;

System.out.println("Key returned for inserted row: "
    + autoIncKeyFromRS);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries

happen on the same connection, but not on the same `Statement` instance.

25.3.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

25.3.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

25.3.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transaction, the connection would otherwise sit idle. Instead, connection pooling allows the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you don't use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it via the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

Example 25.11. Using a connection pool with a J2EE application server

```
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {

    public void doSomething() throws Exception {
        /*
         * Create a JNDI Initial context to be able to
         * lookup the DataSource
         *
         * In production-level code, this should be cached as
         * an instance or static variable, as it can
         * be quite expensive to create a JNDI context.
         *
         * Note: This code only works when you are using servlets
         * or EJBs in a J2EE application server. If you are
         * using connection pooling in standalone Java code, you
         * will have to create/configure datasources using whatever
         * mechanisms your particular connection pooling library
         * provides.
         */

        InitialContext ctx = new InitialContext();

        /*
         * Lookup the DataSource, which will be backed by a pool
         * that the application server provides. DataSource instances
         * are also a good candidate for caching as an instance
         * variable, as JNDI lookups can be expensive as well.
         */

        DataSource ds =
            (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

        /*
         * The following code is what would actually be in your
         * Servlet, JSP or EJB 'service' method...where you need
         * to work with a JDBC connection.
         */

        Connection conn = null;
        Statement stmt = null;

        try {
            conn = ds.getConnection();

            /*
             * Now, use normal JDBC programming to work with
             * MySQL, making sure to close each resource when you're
             * finished with it, which allows the connection pool
             * resources to be recovered as quickly as possible
             */

            stmt = conn.createStatement();
            stmt.execute("SOME SQL QUERY");

            stmt.close();
            stmt = null;

            conn.close();
        }
    }
}
```

```

        conn = null;
    } finally {
        /*
         * close any jdbc instances here that weren't
         * explicitly closed during normal code path, so
         * that we don't 'leak' resources...
         */

        if (stmt != null) {
            try {
                stmt.close();
            } catch (SQLException sqlex) {
                // ignore -- as we can't do anything about it here
            }

            stmt = null;
        }

        if (conn != null) {
            try {
                conn.close();
            } catch (SQLException sqlex) {
                // ignore -- as we can't do anything about it here
            }

            conn = null;
        }
    }
}

```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

What's the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users) using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

25.3.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://jakarta.apache.org/tomcat/tomcat-5.0-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `$_CATALINA_HOME/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to

`$CATALINA_HOME/conf/server.xml` in the context that defines your web application:

```
<Context ....>
...
<Resource name="jdbc/MySQLDB"
           auth="Container"
           type="javax.sql.DataSource"/>

<!-- The name you used above, must match _exactly_ here!

       The connection pool will be bound into JNDI with the name
       "java:/comp/env/jdbc/MySQLDB"
-->

<ResourceParams name="jdbc/MySQLDB">
  <parameter>
    <name>factory</name>
    <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
  </parameter>

  <!-- Don't set this any higher than max_connections on your
       MySQL server, usually this should be a 10 or a few 10's
       of connections, not hundreds or thousands -->

  <parameter>
    <name>maxActive</name>
    <value>10</value>
  </parameter>

  <!-- You don't want to many idle connections hanging around
       if you can avoid it, only enough to soak up a spike in
       the load -->

  <parameter>
    <name>maxIdle</name>
    <value>5</value>
  </parameter>

  <!-- Don't use autoReconnect=true, it's going away eventually
       and it's a crutch for older connection pools that couldn't
       test connections. You need to decide whether your application
       is supposed to deal with SQLExceptions (hint, it should), and
       how much of a performance penalty you're willing to pay
       to ensure 'freshness' of the connection -->

  <parameter>
    <name>validationQuery</name>
    <value>SELECT 1</value>
  </parameter>

  <!-- The most conservative approach is to test connections
       before they're given to your application. For most applications
       this is okay, the query used above is very small and takes
       no real server resources to process, other than the time used
       to traverse the network.

       If you have a high-load application you'll need to rely on
       something else. -->

  <parameter>
    <name>testOnBorrow</name>
    <value>true</value>
  </parameter>

  <!-- Otherwise, or in addition to testOnBorrow, you can test
       while connections are sitting idle -->

  <parameter>
    <name>testWhileIdle</name>
    <value>true</value>
  </parameter>

  <!-- You have to set this value, otherwise even though
       you've asked connections to be tested while idle,
       the idle evictor thread will never run -->

  <parameter>
    <name>timeBetweenEvictionRunsMillis</name>
    <value>10000</value>
```

```

</parameter>

<!-- Don't allow connections to hang out idle too long,
never longer than what wait_timeout is set to on the
server...A few minutes or even fraction of a minute
is sometimes okay here, it depends on your application
and how much spikey load it will see -->

<parameter>
  <name>minEvictableIdleTimeMillis</name>
  <value>60000</value>
</parameter>

<!-- Username and password used when connecting to MySQL -->

<parameter>
  <name>username</name>
  <value>someuser</value>
</parameter>

<parameter>
  <name>password</name>
  <value>somepass</value>
</parameter>

<!-- Class name for the Connector/J driver -->

<parameter>
  <name>driverClassName</name>
  <value>com.mysql.jdbc.Driver</value>
</parameter>

<!-- The JDBC connection url for connecting to MySQL, notice
that if you want to pass any other MySQL-specific parameters
you should pass them here in the URL, setting them using the
parameter tags above will have no effect, you will also
need to use &amp; to separate parameter values as the
ampersand is a reserved character in XML -->

<parameter>
  <name>url</name>
  <value>jdbc:mysql://localhost:3306/test</value>
</parameter>

</ResourceParams>
</Context>

```

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure datasources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```

Error: java.sql.SQLException: Cannot load JDBC driver class 'null ' SQL
state: null

```

25.3.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the `lib` directory for your server configuration (which is usually called `default`). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasource configuration file that ends with `-ds.xml`, which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```

<datasources>
  <local-tx-datasource>
    <!-- This connection pool will be bound into JNDI with the name
         "java:/MySQLDB" -->

    <jndi-name>MySQLDB</jndi-name>
    <connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
    <driver-class>com.mysql.jdbc.Driver</driver-class>
    <user-name>user</user-name>
    <password>pass</password>

```

```

<min-pool-size>5</min-pool-size>

<!-- Don't set this any higher than max_connections on your
MySQL server, usually this should be a 10 or a few 10's
of connections, not hundreds or thousands -->

<max-pool-size>20</max-pool-size>

<!-- Don't allow connections to hang out idle too long,
never longer than what wait_timeout is set to on the
server...A few minutes is usually okay here,
it depends on your application
and how much spikey load it will see -->

<idle-timeout-minutes>5</idle-timeout-minutes>

<!-- If you're using Connector/J 3.1.8 or newer, you can use
our implementation of these to increase the robustness
of the connection pool. -->

<exception-sorter-class-name>com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter</ex
<valid-connection-checker-class-name>com.mysql.jdbc.integration.jboss.MysqlValidConnectionCheck

</local-tx-datasource>
</datasources>

```

25.3.5.3. Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

Questions

- [26.3.5.3.1](#): When I try to connect to the database with MySQL Connector/J, I get the following exception:

```

SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0

```

What's going on? I can connect just fine with the MySQL command-line client.

- [26.3.5.3.2](#): My application throws an SQLException 'No Suitable Driver'. Why is this happening?
- [26.3.5.3.3](#): I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```

SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0

```

- [26.3.5.3.4](#): I have a servlet/application that works fine for a day, and then stops working overnight
- [26.3.5.3.5](#): I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Questions and Answers

26.3.5.3.1: When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be allowed.

You must add the necessary security credentials to the MySQL server for this to happen, using the [GRANT](#) statement to your MySQL Server. See [Section 13.5.1.3, "GRANT Syntax"](#), for more information.

Note. Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special hostname `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the hostname instead.

Warning. Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

26.3.5.3.2: My application throws an SQLException 'No Suitable Driver'. Why is this happening?

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 25.3.2, "Installing Connector/J"](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using `DriverManager`, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

26.3.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the `--skip-networking` option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the `.class` files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the `--skip-networking` flag, or if it is firewalled.

If MySQL has been started with the `--skip-networking` option set (the Debian Linux package of MySQL server does this for example), you need to comment it out in the file `/etc/mysql/my.cnf` or `/etc/my.cnf`. Of course your `my.cnf` file might also exist in the `data` directory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by MySQL

AB always look in `/etc/my.cnf` and `[datadir]/my.cnf`. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

26.3.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the "autoReconnect" parameter (see [Section 25.3.4.1, "Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J"](#)).

Also, you should be catching `SQLExceptions` in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the `SQLState` (see `java.sql.SQLException.getSQLState()` in your APIDocs) to "08S01" when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

Example 25.12. Example of transaction with retry logic

```
public void doBusinessOp() throws SQLException {
    Connection conn = null;
    Statement stmt = null;
    ResultSet rs = null;

    //
    // How many times do you want to retry the transaction
    // (or at least _getting_ a connection)?
    //
    int retryCount = 5;

    boolean transactionCompleted = false;

    do {
        try {
            conn = getConnection(); // assume getting this from a
                                   // javax.sql.DataSource, or the
                                   // java.sql.DriverManager

            conn.setAutoCommit(false);

            //
            // Okay, at this point, the 'retry-ability' of the
            // transaction really depends on your application logic,
            // whether or not you're using autocommit (in this case
            // not), and whether you're using transactional storage
            // engines
            //
            // For this example, we'll assume that it's _not_ safe
            // to retry the entire transaction, so we set retry
            // count to 0 at this point
            //
            // If you were using exclusively transaction-safe tables,
            // or your application could recover from a connection going
            // bad in the middle of an operation, then you would not
            // touch 'retryCount' here, and just let the loop repeat
            // until retryCount == 0.
            //
            retryCount = 0;

            stmt = conn.createStatement();

            String query = "SELECT foo FROM bar ORDER BY baz";

            rs = stmt.executeQuery(query);

            while (rs.next()) {
            }

            rs.close();
            rs = null;
        }
    }
}
```

```

        stmt.close();
        stmt = null;

        conn.commit();
        conn.close();
        conn = null;

        transactionCompleted = true;
    } catch (SQLException sqlEx) {

        //
        // The two SQL states that are 'retry-able' are 08S01
        // for a communications error, and 40001 for deadlock.
        //
        // Only retry if the error was due to a stale connection,
        // communications problem or deadlock
        //

        String sqlState = sqlEx.getSQLState();

        if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
            retryCount--;
        } else {
            retryCount = 0;
        }
    } finally {
        if (rs != null) {
            try {
                rs.close();
            } catch (SQLException sqlEx) {
                // You'd probably want to log this . . .
            }
        }

        if (stmt != null) {
            try {
                stmt.close();
            } catch (SQLException sqlEx) {
                // You'd probably want to log this as well . . .
            }
        }

        if (conn != null) {
            try {
                //
                // If we got here, and conn is not null, the
                // transaction should be rolled back, as not
                // all work has been done

                try {
                    conn.rollback();
                } finally {
                    conn.close();
                }
            } catch (SQLException sqlEx) {
                //
                // If we got an exception here, something
                // pretty serious is going on, so we better
                // pass it up the stack, rather than just
                // logging it. . .

                throw sqlEx;
            }
        }
    }
} while (!transactionCompleted && (retryCount > 0));
}

```

Note. Use of the `autoReconnect` option is not recommended because there is no safe method of re-connecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The `autoReconnect` facility is deprecated, and may be removed in a future release.

26.3.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my res-

ult set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using `UPDATE` or `DELETE` statements on a table where you can individually specify the criteria to be matched using a `WHERE` clause.

25.3.6. Connector/J Support

25.3.6.1. Connector/J Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See Section 1.7.1, “MySQL Mailing Lists”.

Community support from experienced users is also available through the [JDBC Forum](http://forums.mysql.com/list.php?39) [http://forums.mysql.com/list.php?39]. You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See Section 1.7.2, “MySQL Community Support at the MySQL Forums”.

25.3.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to security_at_mysql.com [mailto:security_at_mysql.com].

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you don't waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details don't matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions like, “Why doesn't this work for me?” Then we find that the feature requested wasn't implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, standalone testcase that doesn't involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `'com.mysql.jdbc.util.BaseBugReport'`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (i.e. there's more than one connection involved).
- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from `'jdbc:mysql:///test'`, override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
    new MyBugReport().run();
}
```

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

25.3.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.4, “MySQL Connector/J Change History”](#).

25.4. MySQL Connector/MXJ

MySQL Connector/MXJ is a solution for deploying the MySQL database engine (`mysqld`) intelligently from within a Java package.

25.4.1. Introduction to Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding an additional parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](http://lists.mysql.com/java) [<http://lists.mysql.com/java>].

25.4.1.1. Connector/MXJ Versions

Connector/MX

- Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.0.22 and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.
- Connector/MXJ 1.x includes `mysqld` version 4.1.13 and includes binaries for Linux x86, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 1.x requires the Connector/J 3.x package.

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

25.4.1.2. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

Connector/MXJ Package		
Connector/MXJ Management Class	mysqld Binaries	MySQL Base Databases
	Linux x86	MySQL Stub Data
	Windows XP/NT/2000	
	Solaris SPARC	Support Tools
	MacOS X PowerPC	

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-configured data directory. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

25.4.2. Installing Connector/MXJ

Connector/MXJ does not have an installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer

- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

25.4.2.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqld` binary for a select number of platforms, as outlined below.

- Linux, i386
- Windows NT, Windows 2000, Windows XP, x86
- Solaris 8, SPARC 32 (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X, PowerPC

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 25.4.5.1, “Creating your own Connector/MXJ Package”](#)

25.4.2.2. Connector/MXJ Base Installation

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the `Program Files` directory.

To install the files:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems) or Zip format (Windows).
2. Extract the files from the package. This will create a directory `connector-mxj`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the Connector/MXJ JAR (`connector-mxj.jar`). You will also need to add the AspectJ Runtime, located in `lib/aspectjrt.jar`.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the `Environment Variables` configured through the `System` control panel.

25.4.2.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the `ConnectorMXJUrlTestExample`:

```

java ConnectorMXJUrlTestExample
jdbc:mysql:mxj://localhost:3336/test?server.base_dir=/var/tmp/test-mxj
[MySQLdResource] launching mysqld (getOptions)
[/var/tmp/test-mxj/bin/mysqld][--no-defaults] »
[--pid-file=/var/tmp/test-mxj/data/MySQLdResource.pid] »
[--socket=mysql.sock][--datadir=/var/tmp/test-mxj/data] »
[--port=3336][--basedir=/var/tmp/test-mxj]
[MySQLdResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
InnoDB: a new database to be created!
060726 15:40:42 InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile0 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
060726 15:40:44 InnoDB: Started; log sequence number 0 0
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.22-max' socket: 'mysql.sock' port: 3336 MySQL Community Edition - Experimental (GPL)
[MySQLdResource] mysqld running as process: 1210
-----
5.0.22-max
-----
[MySQLdResource] stopping mysqld (process: 1210)
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown

060726 15:40:45 InnoDB: Starting shutdown...
060726 15:40:48 InnoDB: Shutdown completed; log sequence number 0 43655
060726 15:40:48 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete

[MySQLdResource] clearing options
[MySQLdResource] shutdown complete

```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

25.4.2.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld` server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `connector-mxj.jar` to the `CLASSPATH`.
2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc-
bc:mysql:mxj://localhost:PORT/DATABASE`.

For more details, see [Section 25.4.3, “Connector/MXJ Configuration”](#).

25.4.2.5. Deploying Connector/MXJ within JBoss

For deployment within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ copy the `connector-mxj.jar` file to the

`$JBoss_HOME/server/default/lib` directory.

2. Download Connector/J copy the `connector-mxj.jar` file to the `$JBoss_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$JBoss_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```
String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql:///test?propertiesTransform="+
            "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);
```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

25.4.2.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

25.4.2.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MySQLdResource` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).
2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available via your CLASSPATH.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:
 - JBoss - 4.0rc1 or newer.
 - Apache Tomcat - 5.0 or newer.
 - Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

25.4.2.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj_test_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj_test_silent" Java property to "false".

2. To run the JUnit test suite, the \$CLASSPATH must include the following:
 - JUnit
 - JMX
 - Connector/J
 - MySQL Connector/MXJ
3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysql\djmx
ant dist
```

Then add `$TEMP/cmjxj/stage/connector-mxj/connector-mxj.jar` to the CLASSPATH.

4. if you have `junit`, execute the unit tests. From the command line, type:

```
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

The output should look something like this:

```
.....
.....
.....
Time: 259.438
OK (101 tests)
```

Note that the tests are a bit slow near the end, so please be patient.

25.4.3. Connector/MXJ Configuration

25.4.3.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the `mxj` keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the System.out. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as `src/ConnectorMXJUrlTestExample.java`.

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;

public class ConnectorMXJUrlTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "test-mxj");
        int port = 3336;

        String url = "jdbc:mysql:mxj://localhost:" + port + "/test" + "?"
            + "serverbasedir=" + databaseDir;

        System.out.println(url);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            conn = DriverManager.getConnection(url, userName, password);
            printQueryResults(conn, "SELECT VERSION()");
        } finally {
            try {
                if (conn != null)
                    conn.close();
            } catch (Exception e) {
                e.printStackTrace();
            }

            ServerLauncherSocketFactory.shutdown(databaseDir, null);
        }
    }

    public static void printQueryResults(Connection conn, String SQLquery)
        throws Exception {
        Statement stmt = conn.createStatement();
        ResultSet rs = stmt.executeQuery(SQLquery);
        int columns = rs.getMetaData().getColumnCount();
        System.out.println("-----");
        System.out.println();
        while (rs.next()) {
            for (int i = 1; i <= columns; i++) {
                System.out.println(rs.getString(i));
            }
            System.out.println();
        }
        rs.close();
        stmt.close();
        System.out.println("-----");
        System.out.flush();
        Thread.sleep(100); // wait for System.out to finish flush
    }
}
```

To run the above program, be sure to have `connector-mxj.jar` and `Connector/J` in the CLASSPATH. Then type:

```
java ConnectorMXJTestExample
```

25.4.3.2. Running within a Java Object

If you have a java application and wish to “embed” a MySQL database, make use of the `com.mysql.management.MysqldResource` class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a `java.io.File` object representing the directory you wish the server to be “unzipped” into. It may also be instantiated with printstreams for “stdout” and “stderr” for logging.

Once instantiated, a `java.util.Map`, the object will be able to provide a `java.util.Map` of server options appropriate for the platform and version of MySQL which you will be using.

The `MysqldResource` enables you to “start” MySQL with a `java.util.Map` of server options which you provide, as well as “shutdown” the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJObjectTestExample.java](#).

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;

public class ConnectorMXJObjectTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "mysql-mxj");
        int port = 3336;

        MysqldResource mysqldResource = startDatabase(databaseDir, port);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            String url = "jdbc:mysql://localhost:" + port + "/test";
            conn = DriverManager.getConnection(url, userName, password);
            printQueryResults(conn, "SELECT VERSION()");
        } finally {
            try {
                if (conn != null) {
                    conn.close();
                }
            } catch (Exception e) {
                e.printStackTrace();
            }
            try {
                mysqldResource.shutdown();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }
    }

    public static MysqldResource startDatabase(File databaseDir, int port) {
        MysqldResource mysqldResource = new MysqldResource(databaseDir);

        Map database_options = new HashMap();
        database_options.put("port", Integer.toString(port));
        mysqldResource.start("test-mysqld-thread", database_options);

        if (!mysqldResource.isRunning()) {
```

```

        throw new RuntimeException("MySQL did not start.");
    }

    System.out.println("MySQL is running.");

    return mysqlResource;
}

public static void printQueryResults(Connection conn, String SQLquery)
    throws Exception {
    Statement stmt = conn.createStatement();
    ResultSet rs = stmt.executeQuery(SQLquery);
    int columns = rs.getMetaData().getColumnCount();
    System.out.println("-----");
    System.out.println();
    while (rs.next()) {
        for (int i = 1; i <= columns; i++) {
            System.out.println(rs.getString(i));
        }
        System.out.println();
    }
    rs.close();
    stmt.close();
    System.out.println("-----");
    System.out.flush();
    Thread.sleep(100); // wait for System.out to finish flush
}
}

```

25.4.3.3. Setting server options

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with "server.". In the following example we set two driver parameters and two server parameters:

```

String url = "jdbc:mysql://" + hostColonPort + "/"
    + "?"
    + "cacheServerConfiguration=true"
    + "&"
    + "useLocalSessionState=true"
    + "&"
    + "server.basedir=/opt/myapp/db"
    + "&"
    + "server.datadir=/mnt/bigdisk/myapp/data";

```

25.4.4. Connector/MXJ Reference

25.4.4.1. MysqlResource API

25.4.4.1.1. MysqlResource Constructors

The `MysqlResource` class supports three different constructor forms:

- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err, Utils util)`

The most detailed constructor, enables you to set the base directory, data directory, select a server by its version string, standard out and standard error and MySQL utilities class.

- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err)`

Enables you to set the base directory, data directory, select a server by its version string, standard out

and standard error.

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource(File baseDir);`

Allows the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource();`

The basedir is defaulted to a subdirectory of the java.io.tmpdir. Output for standard out and standard err are directed to System.out and System.err;

25.4.4.1.2. MysqldResource Methods

MysqldResource API includes the following methods:

- `void start(String threadName, Map mysqlArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the MySQL command line. The map is the set of arguments and their values to be passed to the command line.

- `void shutdown();`

Shuts down the MySQL instance managed by the MysqldResource object.

- `Map getServerOptions();`

Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.

- `boolean isRunning();`

Returns true if the MySQL database is running.

- `boolean isReadyForConnections();`

Returns true once the database reports that is ready for connections.

- `void setKillDelay(int millis);`

The default "Kill Delay" is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a "force kill" if the database has not shutdown by itself.

- `void addCompletionListenser(Runnable listener);`

Allows for applications to be notified when the server process completes. Each "listener" will be fired off in its own thread.

- `String getVersion();`

Returns the version of MySQL.

- `void setVersion(int MajorVersion, int minorVersion, int patchLevel);`

The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

25.4.5. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

25.4.5.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysqld` version or platform then you must extract and rebuild the `connector-mxj.jar` file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

The MySQL version directory, `5-0-22` in the above example, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the `data` and `share` directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
Win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the `mysqld` for Mac OS X PowerPC is located within the `Mac_OS_X-ppc` directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific `mysqld`, create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory `Mac_OS_X-i386`.

On Unix systems, you can determine the platform using `uname`:

```
shell> uname -p
i386
```

Now you need to download or compile `mysqld` for the MySQL version and platform you want to include in your custom `connector-mxj.jar` package into the new directory.

Create a file called `version.txt` in the OS/platform directory you have just created that contains the version string/path of the `mysqld` binary. For example:

```
mysql-5.0.22-osx10.3-i386/bin/mysqld
```

You can now recreate the `connector-mxj.jar` file with the added `mysqld`:

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj.jar *
```

You should test this package using the steps outlined in [Section 25.4.2.3, “Connector/MXJ Quick Start Guide”](#).

25.4.5.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom `data_dir.jar` file, as included within the main `connector-mxj.jar` file:

1. First extract the `connector-mxj.jar` file, as outlined in the previous section (see [Section 25.4.5.1, “Creating your own Connector/MXJ Package”](#)).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf ../data_dir.jar mysql mxjtest
```

5. Copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

25.4.5.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as

JBoss version 4. The MBean will use the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. the `MysqldDynamicMBean`, and
2. a `com.sun.jdmk.comm.HtmlAdaptorServer`, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.
 - current JDK, JUnit, Connector/J, MySQL Connector/MXJ
 - this section *requires* the SUN reference implementation of JMX
 - `PATH`, `JAVA_HOME`, `ANT_HOME`, `CLASSPATH`
2. If not building from source, skip to next step

rebuild with the "sunri.present"

```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

3. launch the test agent from the command line:

```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```

4. from a browser:

```
http://localhost:9092/
```

5. under `MysqldAgent`,

```
select "name=mysqlld"
```

6. Observe the MBean View
7. scroll to the bottom of the screen press the `startMysqld` button
8. click `Back to MBean View`
9. scroll to the bottom of the screen press `stopMysqld` button

- kill the java process running the Test Agent (jmx server)

25.4.5.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

- Ensure a current version of java development kit (v1.4.x), see above.
 - Ensure `JAVA_HOME` is set (JBoss requires `JAVA_HOME`)
 - Ensure `JAVA_HOME/bin` is in the `PATH` (You will NOT need to set your `CLASSPATH`, nor will you need any of the jars used in the previous tests).
- Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html
select "Downloads"
select "jboss-4.0.zip"
pick a mirror
unzip ~/dload/jboss-4.0.zip
create a JBOSS_HOME environment variable set to the unzipped directory
unix only:
cd $JBOSS_HOME/bin
chmod +x *.sh
```

- Deploy (copy) the `connector-mxj.jar` to `$JBOSS_HOME/server/default/lib`.
- Deploy (copy) `mysql-connector-java-3.1.4-beta-bin.jar` to `$JBOSS_HOME/server/default/lib`.
- Create a `mxjtest.war` directory in `$JBOSS_HOME/server/default/deploy`.
- Deploy (copy) `index.jsp` to `$JBOSS_HOME/server/default/deploy/mxjtest.war`.
- Create a `mysqld-service.xml` file in `$JBOSS_HOME/server/default/deploy`.

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
  <mbean code="com.mysql.management.jmx.jboss.JBossMysqldDynamicMBean"
    name="mysql:type=service,name=mysqld">
    <attribute name="datadir">/tmp/xxx_data_xxx</attribute>
    <attribute name="autostart">>true</attribute>
  </mbean>
</server>
```

- Start jboss:
 - on unix: `$JBOSS_HOME/bin/run.sh`
 - on windows: `%JBOSS_HOME%\bin\run.bat`

Be ready: JBoss sends a lot of output to the screen.

- When JBoss seems to have stopped sending output to the screen, open a web browser to: <http://localhost:8080/jmx-console>
- Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysqld` link.
- Observe the JMX MBean View page. MySQL should already be running.

12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the `Invoke` button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click `Back to MBean View`
13. To confirm MySQL is running, open a web browser to `http://localhost:8080/mxjtest/` and you should see that

```
SELECT 1
```

returned with a result of

```
1
```

14. Guided by the `$JBOSS_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service `Invoke` button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

25.4.6. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 25.4.6.1, "Connector/MXJ Community Support"](#).

25.4.6.1. Connector/MXJ Community Support

MySQL AB provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](http://lists.mysql.com/java) [http://lists.mysql.com/java] mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, "MySQL Mailing Lists"](#).

Community support from experienced users is also available through the [MyODBC Forum](http://forums.mysql.com/list.php?39) [http://forums.mysql.com/list.php?39]. You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2, "MySQL Community Support at the MySQL Forums"](#).

25.4.6.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 25.4.6.1, "Connector/MXJ Community Support"](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

25.5. Connector/PHP

The PHP distribution and documentation are available from the PHP Web site. MySQL provides the `mysql` and `mysql_i` extensions for the Windows operating system on <http://dev.mysql.com/downloads/connector/php/>. You can find information why you should preferably use the extensions provided by MySQL on that page. For platforms other than Windows, you should use the `mysql` or `mysql_i` extensions shipped with the PHP sources. See [Section 24.3, “MySQL PHP API”](#).

Chapter 26. Extending MySQL

26.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.9.3, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.7.1, “MySQL Mailing Lists”](#). All developers at MySQL AB are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

26.1.1. MySQL Threads

The MySQL server creates the following threads:

- One thread manages TCP/IP file connection requests and creates a new dedicated thread to handle the authentication and SQL statement processing for each connection. (On Unix, this thread also manages Unix socket file connection requests.) On Windows, a similar thread manages shared-memory connection requests, and on Windows NT-based systems, a thread manages named-pipe connection requests. Every client connection has its own thread, although the manager threads try to avoid creating threads by consulting the thread cache first to see whether a cached thread can be used for a new connection.
- On Windows NT, there is a named pipe handler thread that does the same work as the TCP/IP connection thread on named pipe connect requests.
- On a master replication server, slave server connections are like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- The signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread.
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running.

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication threads, and event threads.

26.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a shell script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, you should try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.8, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should edit `mysql-test-run.pl` and change the values of the master or slave port to one that is available.

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run test_name`.

You can use the `mysqltest` language to write your own test cases. This is documented in the MySQL Test Framework manual, available at <http://dev.mysql.com/doc/>.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL [internals](#) mailing list. See [Section 1.7.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

26.2. The MySQL Plugin Interface

MySQL 5.1 and up supports a plugin API that allows the loading and unloading of server components at runtime, without restarting the server. Currently, the plugin API supports creation of full-text parser plugins. Such a plugin can be used to replace or augment the built-in full-text parser. For example, a plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface. The plugin interface eventually will include an API for creating UDFs, and it is intended this plugin UDF API will replace the older non-plugin UDF API. After that point, it will be possible for UDFs to be revised for use as plugin UDFs so that they can take advantage of the better security and versioning capabilities of the plugin API. Eventually, support for the older UDF API will be phased out.

The plugin interface requires the `plugin` table in the `mysql` database. This table is created as part of the MySQL installation process. If you are upgrading from an older version to MySQL 5.1, you should run the `mysql_upgrade` command to create this table. See [Section 5.6.2, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

26.2.1. Characteristics of the Plugin Interface

In some respects, the plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface:

- The plugin framework is extendable to accommodate different kinds of plugins.

Some aspects of the plugin API are common to all types of plugins, but the API also allows for type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Although only the interface for full-text parser plugins is implemented currently, others can be added, such as an interface for UDF plugins.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- Plugin security is improved relative to the UDF interface.

The older interface for writing non-plugin UDFs allowed libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively non-specific. The newer rules are more strict. A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

The newer plugin interface eliminates the security issues of the older UDF interface. When a UDF plugin type is implemented, that will allow non-plugin UDFs to be brought into the plugin framework and the older interface to be phased out.

The plugin implementation includes the following components:

Source files (the locations given indicate where the files are found in a MySQL source distribution):

- `include/mysql/plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library.
- `sql/sql_plugin.h` and `sql/sql_plugin.cc` comprise the internal plugin implementation. These files need not be consulted by plugin writers. They may be of interest for those who want to know more about how the server handles plugins.

System table:

- The `plugin` table in the `mysql` database lists each installed plugin and is required for plugin use.

For new MySQL installations, this table is created during the installation process. If you are upgrading from a version older than MySQL 5.1, you should run `mysql_upgrade` to update your system tables and create the `plugin` table (see [Section 5.6.2, “mysql_upgrade — Check Tables for MySQL Upgrade”](#)).

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about known plugins. The `PLUGINS` table in `INFORMATION_SCHEMA` also contains plugin information.

System variable:

- `plugin_dir` indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=path` option.

26.2.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 12.7, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_XXX` sys-

tem variables and the stopword list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from non-plaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER my_parser
);
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

26.2.3. INSTALL PLUGIN Syntax

```
INSTALL PLUGIN plugin_name SONAME 'plugin_library'
```

This statement installs a plugin.

plugin_name is the name of the plugin as defined in the plugin declaration structure contained in the library file. Plugin name case sensitivity is determined by the host system filename semantics.

plugin_library is the name of the shared library that contains the plugin code. The name includes the filename extension (for example, `libmyplugin.so` or `libmyplugin.dylib`).

The shared library must be located in the plugin directory (that is, the directory named by the `plugin_dir` system variable). The library must be in the plugin directory itself, not in a subdirectory. By default, `plugin_dir` is the directory named by the `pkglibdir` configuration variable, but it can be changed by setting the value of `plugin_dir` at server startup. For example, set its value in a `my.cnf` file:

```
[mysqld]
plugin_dir=/path/to/plugin/directory
```

If the value of `plugin_dir` is a relative pathname, it is taken to be relative to the MySQL base directory (the value of the `basedir` system variable).

`INSTALL PLUGIN` adds a line to the `mysql.plugin` table that describes the `plugin`. This table

contains the plugin name and library filename.

`INSTALL PLUGIN` also loads and initializes the plugin code to make the plugin available for use. A plugin is initialized by executing its initialization function, which handles any setup that the plugin must perform before it can be used.

To use `INSTALL PLUGIN`, you must have the `INSERT` privilege for the `mysql.plugin` table.

At server startup, the server loads and initializes any plugin that is listed in the `mysql.plugin` table. This means that a plugin is installed with `INSTALL PLUGIN` only once, not every time the server starts. Plugin loading at startup does not occur if the server is started with the `-skip-grant-tables` option.

When the server shuts down, it executes the deinitialization function for each plugin that is loaded so that the plugin has a chance to perform any final cleanup.

To remove a plugin entirely, use the `UNINSTALL PLUGIN` statement:

To see what plugins are installed, use the `SHOW PLUGIN` statement.

If you recompile a plugin library and need to reinstall it, you can use either of the following procedures:

- Use `UNINSTALL PLUGIN` to uninstall all plugins in the library, install the new plugin library file in the plugin directory, and then use `INSTALL PLUGIN` to install all plugins in the library. This procedure has the advantage that it can be used without stopping the server. However, if the plugin library contains many plugins, you must issue many `INSTALL PLUGIN` and `UNINSTALL PLUGIN` statements.
- Alternatively, stop the server, install the new plugin library file in the plugin directory, and then restart the server.

26.2.4. UNINSTALL PLUGIN Syntax

```
UNINSTALL PLUGIN plugin_name
```

This statement removes an installed plugin. You cannot uninstall a plugin if any table that uses it is open.

plugin_name must be the name of some plugin that is listed in the `mysql.plugin` table. The server executes the plugin's deinitialization function and removes the row for the plugin from the `mysql.plugin` table, so that subsequent server restarts will not load and initialize the plugin. `UNINSTALL PLUGIN` does not remove the plugin's shared library file.

To use `UNINSTALL PLUGIN`, you must have the `DELETE` privilege for the `mysql.plugin` table.

Plugin removal has implications for the use of associated tables. For example, if a full-text parser plugin is associated with a `FULLTEXT` index on the table, uninstalling the plugin makes the table unusable. Any attempt to access the table results in an error. The table cannot even be opened, so you cannot drop an index for which the plugin is used. This means that uninstalling a plugin is something to do with care unless you do not care about the table contents. If you are uninstalling a plugin with no intention of reinstalling it later and you care about the table contents, you should dump the table with `mysqldump` and remove the `WITH PARSER` clause from the dumped `CREATE TABLE` statement so that you can reload the table later. If you do not care about the table, `DROP TABLE` can be used even if any plugins associated with the table are missing.

26.2.5. Writing Plugins

This section describes the general and type-specific parts of the plugin API. It also provides a step-by-step guide to creating a plugin library. For example plugin source code, see the [plugin/full-text](#) directory of a MySQL source distribution.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. Note that these constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins that were originally written for older servers. For information about these constraints, see [Section 2.9.2, “Typical configure Options”](#), and [Section 2.9.4, “Dealing with Problems Compiling MySQL”](#).

26.2.5.1. General Plugin Structures and Functions

Every plugin must have a general plugin declaration. The declaration corresponds to the `st_mysql_plugin` structure in the `plugin.h` file:

```
struct st_mysql_plugin
{
  int type;           /* the plugin type (a MYSQL_XXX_PLUGIN value) */
  void *info;        /* pointer to type-specific plugin descriptor */
  const char *name;  /* plugin name */
  const char *author; /* plugin author (for SHOW PLUGINS) */
  const char *descr; /* general descriptive text (for SHOW PLUGINS) */
  int (*init)(void); /* the function to invoke when plugin is loaded */
  int (*deinit)(void); /* the function to invoke when plugin is unloaded */
  unsigned int version; /* plugin version (for SHOW PLUGINS) */
  struct st_mysql_show_var *status_vars;
};
```

The `st_mysql_plugin` structure is common to every type of plugin. Its members should be filled in as follows:

- `type`

The plugin type. This must be one of the plugin-type values from `plugin.h`. For a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`

A pointer to the descriptor for the plugin. Unlike the general plugin declaration structure, this descriptor's structure depends on the particular type of plugin. Each descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. The descriptor for full-text plugins is described in [Section 26.2.5.2, “Type-Specific Plugin Structures and Functions”](#).

- `name`

The plugin name. This is the name that will be listed in the `plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`.

- `author`

The plugin author. This can be whatever you like.

- `desc`

A general description of the plugin. This can be whatever you like.

- `init`

A once-only initialization function. This is executed when the plugin is loaded, which happens for `INSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server startup. The function takes no arguments. It returns zero for success and non-zero for failure. If an `init` function is unneeded for a plugin, it can be specified as 0.

- `deinit`

A once-only deinitialization function. This is executed when the plugin is unloaded, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server shutdown. The function takes no arguments. It returns zero for success and non-zero for failure. If a `deinit` function is unneeded for a plugin, it can be specified as 0.

- `version`

The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- `status_vars`

A pointer to a structure for status variables associated with the plugin, or 0 if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

The `init` and `deinit` functions in the general plugin declaration are invoked only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

The `status_vars` member, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the allowable status variable `type` values and what the corresponding variable should be:

Type	Meaning
<code>SHOW_BOOL</code>	Pointer to a boolean variable
<code>SHOW_INT</code>	Pointer to an integer variable
<code>SHOW_LONG</code>	Pointer to a long integer variable
<code>SHOW_LONGLONG</code>	Pointer to a longlong integer variable
<code>SHOW_CHAR</code>	A string

<code>SHOW_CHAR_PTR</code>	Pointer to a string
<code>SHOW_ARRAY</code>	Pointer to another <code>st_mysql_show_var</code> array
<code>SHOW_FUNC</code>	Pointer to a function

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this calling sequence:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024

typedef int (*mysql_show_var_func) (void *thd,
                                   struct st_mysql_show_var *out,
                                   char *buf);
```

Plugins should consider the `thd` parameter to be read-only.

26.2.5.2. Type-Specific Plugin Structures and Functions

In the `st_mysql_plugin` structure that defines a plugin's general declaration, the `info` member points to a type-specific plugin descriptor. For a full-text parser plugin, the descriptor corresponds to the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has a version number (`MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins) and contains pointers to three functions. The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

Note that the plugin declaration in the plugin library descriptor has initialization and deinitialization functions, and so does the plugin descriptor to which it points. These pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the plugin library descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.

- For the plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or non-zero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                     char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

Note: The definition shown is current as of MySQL 5.1.12. It is incompatible with versions of MySQL 5.1 older than 5.1.12.

The structure members are used as follows:

- `mysql_parse`

A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`

A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- `ftparser_state`

This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- `mysql_ftparam`

This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- `cs`

A pointer to information about the character set of the text, or 0 if no information is available.

- `doc`

A pointer to the text to be parsed.

- `length`

The length of the text to be parsed, in bytes.

- `flags`

Parser flags. This is zero if there are no special flags. Currently, the only non-zero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.) This member was added in MySQL 5.1.12.

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`

The parsing mode. This value will be one of the following constants:

- `MYSQL_FTPARSER_SIMPLE_MODE`

Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopwords list to determine which words to ignore, it should not pass such words to the server.

- `MYSQL_FTPARSER_WITH_STOPWORDS`

Parse in stopwords mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

- `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`

Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens via the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    bool wasign;
    bool trunc;
    /* These are parser state and must be removed. */
}
```

```
byte prev;
byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`

The token type. This should be one of values shown in the following table:

Type	Meaning
FT_TOKEN_EOF	End of data
FT_TOKEN_WORD	A regular word
FT_TOKEN_LEFT_PAREN	The beginning of a group or subexpression
FT_TOKEN_RIGHT_PAREN	The end of a group or subexpression
FT_TOKEN_STOPWORD	A stopword

- `yesno`

Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- `weight_adjust`

A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 12.7.1, “Boolean Full-Text Searches”](#), that use the < and > operators illustrate how weighting works.

- `wasign`

The sign of the weighting factor. A negative value acts like the ~ boolean-search operator, which causes the word's contribution to the relevance to be negative.

- `trunc`

Whether matching should be done as if the boolean-mode * truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

26.2.5.3. Creating a Plugin Library

This section provides a step-by-step procedure for creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are non-empty runs of whitespace characters.

Each plugin library has the following contents:

- A plugin library descriptor that indicates the version number of the general plugin API that the lib-

rary uses and that contains a general declaration for each plugin in the library.

- Each plugin general declaration contains information that is common to all types of plugin: A value that indicates the plugin type; the plugin name, author, and description; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.
- The plugin general declaration also contains a pointer to a type-specific plugin descriptor. The structure of these descriptors can vary from one plugin type to another, because each type of plugin can have its own API. A plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.
- The plugin library contains the interface functions that are referenced by the library descriptor and by the plugin descriptors.

To create a plugin library, follow these steps:

1. Include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

2. Set up the plugin library file descriptor.

Every plugin library must include a library descriptor that must define two symbols:

- `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin
... one or more plugin declarations here ...
mysql_declare_plugin_end;
```

For example, the library descriptor for a library that contains a single plugin named `simple_parser` looks like this:

```
mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,          /* type           */
    &simple_parser_descriptor,       /* descriptor     */
    "simple_parser",                 /* name           */
    "MySQL AB",                     /* author         */
}
```

```

"Simple Full-Text Parser", /* description          */
simple_parser_plugin_init, /* init function (when loaded) */
simple_parser_plugin_deinit, /* deinit function (when unloaded) */
0x0001, /* version */
simple_status /* status variables */
}
mysql_declare_plugin_end;

```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

The `mysql_declare_plugin` and `mysql_declare_plugin_end` macros are defined in `plugin.h` like this:

```

#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
int PSIZE= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION; \
int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin _mysql_plugin_declarations[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
    builtin_ ## NAME ## _plugin_interface_version, \
    builtin_ ## NAME ## _sizeof_struct_st_plugin, \
    builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0}

```

One point to note about those definitions is that the `_mysql_plugin_interface_version` symbol is defined only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you'll need to provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version` and `_mysql_plugin_declarations`):

```

int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION;
struct st_mysql_plugin _mysql_plugin_declarations[]= {
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    "simple_parser", /* name */
    "MySQL AB", /* author */
    "Simple Full-Text Parser", /* description */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status /* status variables */
}
, {0,0,0,0,0,0,0,0}
};

```

The preceding example declares a single plugin in the library descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as

the `st_mysql_plugin` structure should be initialized with constant variables. See the discussion at the end of this section that describes some legal and illegal initializers for plugins.

3. Set up the plugin descriptor.

Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```
static struct st_mysql_ftparser simple_parser_descriptor=
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version      */
    simple_parser_parse,             /* parsing function       */
    simple_parser_init,              /* parser init function   */
    simple_parser_deinit             /* parser deinit function */
};
```

4. Set up the plugin interface functions.

The general plugin declaration in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void)
{
    return(0);
}

static int simple_parser_plugin_deinit(void)
{
    return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers non-empty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
```

```

{
  char *end, *start, *docend= param->doc + param->length;
  for (end= start= param->doc;; end++)
  {
    if (end == docend)
    {
      if (end > start)
        add_word(param, start, end - start);
      break;
    }
    else if (isspace(*end))
    {
      if (end > start)
        add_word(param, start, end - start);
      start= end + 1;
    }
  }
  return(0);
}

```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```

static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
  MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
    { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };
  param->mysql_add_word(param, word, len, &bool_info);
}

```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in [Section 26.2.5.2, “Type-Specific Plugin Structures and Functions”](#).

5. Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```

long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
  { "static", (char *)"just a static text", SHOW_CHAR},
  { "called", (char *)&number_of_calls, SHOW_LONG},
  { 0,0,0}
};

```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```

mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0 |
+-----+-----+

```

6. Compile the plugin library as a shared library and install it in the plugin directory.

Note: As mentioned earlier, be sure to specify `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

The procedure for compiling shared objects varies from system to system. If you build your library using the GNU autotools, `libtool` should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The filename might have a different extension on your system.)

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+-----+
| Variable_name | Value                               |
+-----+-----+
| plugin_dir    | /usr/local/mysql/lib/mysql        |
+-----+-----+
```

When you install the plugin library, make sure that its permissions allow it to be executed by the server.

7. Register the plugin with the server.

The `INSTALL PLUGIN` statement causes the server to list the plugin in the `plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+-----+-----+
| name          | dl                               |
+-----+-----+
| simple_parser | libmypluglib.so                 |
+-----+-----+
1 row in set (0.00 sec)
```

8. Try the plugin.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
-> FULLTEXT (c) WITH PARSER simple_parser);
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all non-whitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
-> ('latin1_general_cs is a case-sensitive collation'),
-> ('I\'d like a case of oranges'),
-> ('this is sensitive information'),
-> ('another row'),
-> ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT c FROM t;
+-----+
| c                                           |
+-----+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges                 |
| this is sensitive information               |
| another row                                |
| yet another row                            |
+-----+
```

```

+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
|                            |
|                            |
|                            |
|                            |
|                            |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
|                                |
|                                |
|                                |
|                                |
|                                |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
|                                    |
|                                    |
|                                    |
|                                    |
|                                    |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\d') FROM t;
+-----+
| MATCH(c) AGAINST('I\d') |
+-----+
|                            |
|                            |
|                            |
|                            |
|                            |
+-----+
5 rows in set (0.01 sec)

```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. The `simple_parser` descriptor shown earlier is allowable in a C++ plugin because it satisfies that requirement:

```

mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN,      /* type */
  &simple_parser_descriptor,  /* descriptor */
  "simple_parser",            /* name */
  "MySQL AB",                /* author */
  "Simple Full-Text Parser", /* description */
  simple_parser_plugin_init, /* init function (when loaded) */
  simple_parser_plugin_deinit, /* deinit function (when unloaded) */
  0x0001,                    /* version */
  simple_status              /* status variables */
}
mysql_declare_plugin_end;

```

Here is another valid way to write the descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "MySQL AB";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,          /* type                */
    &simple_parser_descriptor,       /* descriptor          */
    simple_parser_name,             /* name                */
    simple_parser_author,          /* author              */
    simple_parser_description,      /* description         */
    simple_parser_plugin_init,     /* init function (when loaded) */
    simple_parser_plugin_deinit,   /* deinit function (when unloaded) */
    0x0001,                        /* version             */
    simple_status                   /* status variables    */
}
mysql_declare_plugin_end;
```

However, the following descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```
typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "MySQL AB",
    "Simple Full-Text Parser"
};

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,          /* type                */
    &simple_parser_descriptor,       /* descriptor          */
    parser_info.name,               /* name                */
    parser_info.author,             /* author              */
    parser_info.description,        /* description         */
    simple_parser_plugin_init,     /* init function (when loaded) */
    simple_parser_plugin_deinit,   /* deinit function (when unloaded) */
    0x0001,                        /* version             */
    simple_status                   /* status variables    */
}
mysql_declare_plugin_end;
```

26.3. Adding New Functions to MySQL

There are two ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 26.3.2, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.

Each method has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is described in [Chapter 18, Stored Procedures and Functions](#).

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

26.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number and types of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

26.3.2. CREATE FUNCTION Syntax

```
CREATE [AGGREGATE] FUNCTION function_name RETURNS {STRING|INTEGER|REAL|DECIMAL}
SONAME shared_library_name
```

A user-defined function (UDF) is a way to extend MySQL with a new function that works like a native (built-in) MySQL function such as `ABS()` or `CONCAT()`.

function_name is the name that should be used in SQL statements to invoke the function. The `RETURNS` clause indicates the type of the function's return value. `DECIMAL` is a legal value after `RETURNS`, but currently `DECIMAL` functions return string values and should be written like `STRING` functions.

shared_library_name is the basename of the shared object file that contains the code that implements the function. The file must be located in the plugin directory. This directory is given by the value

of the `plugin_dir` system variable. (**Note:** This is a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.)

To create a function, you must have the `INSERT` privilege for the `mysql` database. This is necessary because `CREATE FUNCTION` adds a row to the `mysql.func` system table that records the function's name, type, and shared library name. If you do not have this table, you should run the `mysql_upgrade` command to create it. See [Section 5.6.2, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

For instructions on writing user-defined functions, see [Section 26.3.4, “Adding a New User-Defined Function”](#). For the UDF mechanism to work, functions must be written in C or C++ (or another language that can use C calling conventions), your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

An `AGGREGATE` function works exactly like a native MySQL aggregate (summary) function such as `SUM` or `COUNT()`. For `AGGREGATE` to work, your `mysql.func` table must contain a `type` column. If your `mysql.func` table does not have this column, you should run the `mysql_upgrade` program to create it (see [Section 5.6.2, “mysql_upgrade — Check Tables for MySQL Upgrade”](#)).

26.3.3. DROP FUNCTION Syntax

```
DROP FUNCTION function_name
```

This statement drops the user-defined function (UDF) named *function_name*.

To drop a function, you must have the `DELETE` privilege for the `mysql` database. This is because `DROP FUNCTION` removes a row from the `mysql.func` system table that records the function's name, type, and shared library name.

26.3.4. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. The MySQL source distribution includes a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the `include/mysql_com.h` header file. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. Note that these constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.9.2, “Typical configure Options”](#), and [Section 2.9.4, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `--with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `--with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

If you must use a precompiled distribution of MySQL, use MySQL-Max, which contains a dynamically linked server that supports dynamic loading.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here:

SQL Type	C/C++ Type
STRING	char *
INTEGER	long long
REAL	double

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `XXX()`.
- To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()` (required in 5.1)

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()` (required)

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each new row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

26.3.4.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 26.3.4, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
            char *is_null, char *error);
```

DECIMAL functions return string values and should be declared the same way as **STRING** functions. **ROW** functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return `NULL`. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. (For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.)

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

26.3.4.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 26.3.4, “Adding a New User-Defined Function”](#), describes the order in which MySQL

calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
char *xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.1, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
char *xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.1.

- `xxx_add()`

This function is called for all rows that belong to the same group, except for the first row. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
char *xxx_add(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See [Section 26.3.4.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See [Section 26.3.4.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate UDFs. See [Section 26.3.4.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error!` `error`

points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

26.3.4.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message, "XXX() requires two arguments");
    return 1;
}
```

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them like `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to access the value properly.) For a non-constant

argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. You should not assume that strings are null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.
- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

26.3.4.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*result` and `*length` to the contents and length of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

The `result` buffer that is passed to the `xxx()` function is 255 bytes long. If your result fits in this, you don't have to worry about memory allocation for results.

If your string function needs to return a string longer than 255 bytes, you must allocate the space for it with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See [Section 26.3.4.1, “UDF Calling Sequences for Simple Functions”](#).

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `xxx()` was invoked. (`xxx()` is not even called for subsequent rows.)

26.3.4.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it's more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a hostname.
- `reverse_lookup()` returns the hostname for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable. (**Note:** This a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.)

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the BitKeeper source repository for MySQL 5.1. See [Section 2.9.3, “Installing from the Development Source Tree”](#).
2. You must obtain the CMake build utility from <http://www.cmake.org>. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` and `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wsock32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.so';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
```

```
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

26.3.4.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable. (**Note:** This a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.)

26.3.5. Adding a New Native Function

The procedure for adding a new native function is described here. Note that you cannot add native functions to a binary distribution because the procedure involves modifying MySQL source code. You must compile MySQL yourself from a source distribution. Also note that if you migrate to another version of MySQL (for example, when a new version is released), you need to repeat the procedure with the new version.

To add a new native MySQL function, follow these steps:

1. Add one line to `lex.h` that defines the function name in the `sql_functions[]` array.
2. If the function prototype is simple (just takes zero, one, two or three arguments), you should in `lex.h` specify `SYM(FUNC_ARGN)` (where `N` is the number of arguments) as the second argument in the `sql_functions[]` array and add a function that creates a function object in `item_create.cc`. Take a look at "ABS" and `create_funcs_abs()` for an example of this.

If the function prototype is complicated (for example, if it takes a variable number of arguments), you should add two lines to `sql_yacc.yy`. One indicates the preprocessor symbol that `yacc` should define (this should be added at the beginning of the file). Then define the function parameters and add an “item” with these parameters to the `simple_expr` parsing rule. For an example, check all occurrences of `ATAN` in `sql_yacc.yy` to see how this is done.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. You can take a look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, don't use any global or static variables in the functions without protecting them with mutexes)

If you want to return `NULL`, from `::val()`, `::val_int()` or `::str()` you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are some additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

26.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

Additionally, we recommend that you take a look at [mylua](#). With this you can use the LUA language to load a procedure at runtime into `mysqld`.

26.4.1. Procedure Analyse

```
analyse([max_elements],[max_memory])
```

This procedure is defined in the `sql/sql_analyse.cc`. This examines the result from your query and returns an analysis of the results:

- `max_elements` (default 256) is the maximum number of distinct values `analyse` does notice per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`.
- `max_memory` (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to find all distinct values.

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements],[max_memory])
```

26.4.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

Appendix A. Problems and Common Errors

This appendix lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

A.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problem (such as memory, motherboard, CPU, or hard disk) or kernel problem:
 - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
 - The mouse pointer doesn't move.
 - The machine doesn't answer to a remote machine's pings.
 - Other programs that are not related to MySQL don't behave correctly.
 - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as [glibc](#)) are up to date.

It's always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.12, "MySQL Server Logs"](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it's time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when

you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it's always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.8, “How to Report Bugs or Problems”](#).

A.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

A.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See [Section 5.8.8, “Causes of Access denied Errors”](#), and [Section 5.8.2, “How the Privilege System Works”](#).

A.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the filesystem (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a hostname or if you specify the special hostname `localhost`.

If the MySQL server is running on Windows 9x or Me, you can connect only via TCP/IP. If the server is running on Windows NT, 2000, XP, or 2003 and is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a hostname when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the hostname.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket filename or TCP/IP port number when trying to connect to the server.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that

the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, the network port you specified is the one configured on the server, and that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2.3](#), “Starting and Troubleshooting the MySQL Server”.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket filename might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=socket --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current hostname) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the hostname of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section A.2.2.1](#), “Connection to MySQL Server Failing on Windows”.
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.1.1](#), “Operating Systems On Which MySQL Is Known To Run”. However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the hostname explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section A.4.5](#), “How to Protect or Change the MySQL Unix Socket File”.
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket pathname for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section A.4.5](#), “How to Protect or Change the MySQL Unix Socket File”.

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket filename in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- Make sure that your `mysqld` server was not started with the `--skip-networking` option. If it was, you cannot connect to it using TCP/IP.
- Check to make sure that there is no firewall blocking access to MySQL. Applications such as ZoneAlarm and the Windows XP personal firewall may need to be configured to allow external access to a MySQL server.

A.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore

the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor ([Regedt32.exe](#)).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in **TIME_WAIT** state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

A.2.3. Client does not support authentication protocol

MySQL 5.1 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the **SET PASSWORD** statement and the **OLD_PASSWORD()** function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “*newpwd*” in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
 1. Start `mysqld` with the `--old-passwords` option.
 2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

Note: In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](http://forums.mysql.com/list.php?52) [http://forums.mysql.com/list.php?52].

For additional background on password hashing and authentication, see [Section 5.8.9, “Password Hashing as of MySQL 4.1”](#).

A.2.4. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

A.2.5. Host '*host_name*' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '*host_name*' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.  
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.2.3, “System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysql_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

A.2.6. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. Its default value is 100. If you need to support more connections, you should restart `mysqld` with a larger value for this variable.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 13.5.4.23, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by MySQL AB can support up to 4000 connections.

A.2.7. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'  
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)  
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `-quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

A.2.8. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent):

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.2.3, “System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

Prior to MySQL 5.1.8, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

The solution to this is to either do a `mysql_ping` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If

`mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section A.2.9, “Packet too large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if hostname lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.12.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section E.1.6, “Making a Test Case If You Experience Table Corruption”](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the `--log` option to determine whether the problem query appears in the log?

See also [Section A.2.10, “Communication Errors and Aborted Connections”](#), and [Section 1.8, “How to Report Bugs or Problems”](#).

A.2.9. Packet too large

A communication packet is a single SQL statement sent to the MySQL server or a single row that is sent to the client.

The largest possible packet that can be transmitted to or from a MySQL 5.1 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

A.2.10. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.12.2, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If `Aborted connections` messages appear in the error log, the cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.2.3, “System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

When any of these things happen, the server increments the `Aborted_clients` status variable.

The server increments the `Aborted_connects` status variable when the following things happen:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.2.3, “System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server!

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section A.2.9, “Packet too large”](#).

See also [Section A.2.8, “MySQL server has gone away”](#).

A.2.11. The table is full

There are several ways a full-table error can occur:

- You are using a MySQL server older than 3.23 and an in-memory temporary table becomes larger than `tmp_table_size` bytes. To avoid this problem, you can use the `--tmp_table_size=val` option to make `mysqld` increase the temporary table size or use the SQL option `SQL_BIG_TABLES` before you issue the problematic query. See [Section 13.5.3, “SET Syntax”](#).

You can also start `mysqld` with the `--big-tables` option. This is exactly the same as using

`SQL_BIG_TABLES` for all queries.

As of MySQL 3.23, this problem should not occur. If an in-memory temporary table becomes larger than `tmp_table_size`, the server automatically converts it to a disk-based `MyISAM` table.

- You are using `InnoDB` tables and run out of room in the `InnoDB` tablespace. In this case, the solution is to extend the `InnoDB` tablespace. See [Section 14.5.7, “Adding and Removing InnoDB Data and Log Files”](#).
- You are using `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a `MyISAM` table and the space required for the table exceeds what is allowed by the internal pointer size. If you don't specify the `MAX_ROWS` table option when you create a table, MySQL uses the `myisam_data_pointer_size` system variable. The default value is 6 bytes, which is enough to allow 256TB of data. See [Section 5.2.3, “System Variables”](#).

You can check the maximum data/index sizes by using this statement:

```
SHOW TABLE STATUS FROM database LIKE 'tbl_name';
```

You also can use `myisamchk -dv /path/to/table-index-file`.

If the pointer size is too small, you can fix the problem by using `ALTER TABLE`:

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify `AVG_ROW_LENGTH` only for tables with `BLOB` or `TEXT` columns; in this case, MySQL can't optimize the space required based only on the number of rows.

A.2.12. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.3.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the filesystem is full:

```
shell> perror 28
Error code 28: No space left on device
```

A.2.13. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

A.2.14. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long) and you didn't start `mysqld` with the `--old-protocol` option. Update the account in the `user` table to have a new password or restart `mysqld` with the `--old-protocol` option.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
-> WHERE User='some_user' AND Host='some_host';
```

A.2.15. Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a filesystem that has case-sensitive filenames.
- Even for filesystems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 13.5.4](#),

[SHOW Syntax](#)".

A.2.16. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `-with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See [Section 2.9.2, "Typical configure Options"](#).

All standard MySQL binaries are compiled with `-with-extra-character-sets=complex`, which enables support for all multi-byte character sets. See [Section 5.11.1, "The Character Set Used for Data and Sorting"](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.2, "Typical configure Options"](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

A.2.17. File Not Found

If you get `ERROR '...' not found (errno: 23), Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
Error code 23: File table overflow
shell> perror 24
Error code 24: Too many open files
shell> perror 11
Error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `-open-files-limit` option to `mysqld_safe` or (as of MySQL 3.23.30) set the `open_files_limit` system variable. See [Section 5.2.3, "System Variables"](#). The easiest way to set

these values is to add an option to your option file. See [Section 4.3.2, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note: If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

A.3. Installation-Related Issues

A.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the pathname of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.9, “MySQL Installation Using a Source Distribution”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this

is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

A.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

In MySQL 3.23.25 and above, MySQL assumes that the value for `UMASK` and `UMASK_DIR` is in octal if it starts with a zero.

See [Appendix F, *Environment Variables*](#).

A.4. Administration-Related Issues

A.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it is recommended to set a password for each account. See [Section 5.7.1, “General Security Guidelines”](#).

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The following procedure is for Windows systems. The procedure for Unix systems is given later in this section.

The procedure under Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Then find the MySQL service in the list, and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `C:\mysql-init.txt`.

4. Open a console window to get to the DOS command prompt:

```
Start Menu -> Run -> cmd
```

5. We are assuming that you installed MySQL to `C:\mysql`. If you installed MySQL to another location, adjust the following commands accordingly.

At the DOS command prompt, execute this command:

```
C:\> C:\mysql\bin\mysqld-nt --init-file=C:\mysql-init.txt
```

The contents of the file named by the `--init-file` option are executed at server startup, changing the `root` password. After the server has started successfully, you should delete `C:\mysql-init.txt`.

If you install MySQL using the MySQL Installation Wizard, you may need to specify a `-defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld-nt.exe"  
--defaults-file="C:\Program Files\MySQL\MySQL Server 5.1\my.ini"  
--init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Find the MySQL service in the list, right-click on it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

6. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.
7. You should be able to connect using the new password.

In a Unix environment, the procedure for resetting the `root` password is as follows:

1. Log on to your system as either the Unix `root` user or as the same user that the `mysqld` server runs as.
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, hostname, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the filename has the extension of `.pid` and begins with either `mysqld` or your system's hostname.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the pathname of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `~/mysql-init`.

4. Restart the MySQL server with the special `--init-file=~/mysql-init` option:

```
shell> mysqld_safe --init-file=~/mysql-init &
```

The contents of the init-file are executed at server startup, changing the root password. After the server has started successfully you should delete `~/mysql-init`.

5. You should be able to connect using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables --user=root` options (Windows users omit the `--user=root` portion).
2. Connect to the `mysqld` server with this command:

```
shell> mysql -u root
```

3. Issue the following statements in the `mysql` client:

```
mysql> UPDATE mysql.user SET Password=PASSWORD('newpwd')
-> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

Replace “`newpwd`” with the actual `root` password that you want to use.

4. You should be able to connect using the new password.

A.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are

no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.12.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [Section E.1.4, “Using a Stack Trace”](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good filesystem locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it's at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, Database Administration](#).
- Start `mysqld` with the `--log` option and try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.12.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.8, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [Section E.1.6, “Making a Test Case If You Experience Table Corruption”](#).

- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 26.1.2, “MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to `configure` and then recompile. See [Section E.1, “Debugging a MySQL Server”](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
 1. Start `mysqld` from `gdb` (or another debugger). See [Section E.1.3, “Debugging mysqld under gdb”](#).
 2. Run your test scripts.
 3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.8, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER`

TABLE. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use at MySQL AB for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to both RAMS and hard-drives when troubleshooting hardware.

A.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

A.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the `TMPDIR` environment variable as the pathname of the directory in which to store temporary files. If you don't have `TMPDIR` set, MySQL uses the system default, which is normally `/tmp`, `/var/tmp`, or `/usr/tmp`. If the filesystem containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a filesystem where you have enough space.

In MySQL 5.1, the `--tmpdir` option can be set to a list of several paths that are used in round-robin

fashion. Paths should be separated by colon characters (':') on Unix and semicolon characters(';') on Windows, NetWare, and OS/2. **Note:** To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based filesystem or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the filesystem in which the temporary file directory is located.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

A.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.3.2, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See [Section 2.9.2, “Typical configure Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

A.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Appendix F, *Environment Variables*](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

A.5. Query-Related Issues

A.5.1. Case Sensitivity in Searches

By default, MySQL searches are not case sensitive (although there are some character sets that are never case insensitive, such as `czech`). This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. If you want to make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation. For example:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 13.1.7, “CREATE TABLE Syntax”](#).

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character’s “sort value.” Characters with the same sort value (such as ‘`E`’, ‘`e`’, and ‘`Ã#Â©`’) are treated as the same character.

A.5.2. Problems Using `DATE` Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When using a `'0000-00-00'` date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the

month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also allows you to store `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a `0` is stored in the `DATE` column, which is retrieved as `'0000-00-00'`. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by `IGNORE`), you should set `sql_mode` to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

A.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with `NULL` Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word `"NULL"` may also be used under some circumstances. See [Section 13.2.5, "LOAD DATA INFILE Syntax"](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

A.5.4. Problems with Column Aliases

You can use an alias to refer to a column in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. Aliases can also be used to give columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

A.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 13.5.4.26](#), “`SHOW TABLE STATUS Syntax`”, and [Section 13.5.4.9](#), “`SHOW CREATE TABLE Syntax`”.

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 13.5.4.13](#), “`SHOW ENGINES Syntax`”, and [Section 13.5.4.29](#), “`SHOW VARIABLES Syntax`”.

A.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

A.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 7.2.1](#), “`Optimizing Queries with EXPLAIN`”.
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it's a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (=) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section A.5.8](#), “`Problems with Floating-Point Comparisons`”.
6. If you still can't figure out what's wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.8, “How to Report Bugs or Problems”](#).

A.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such. For `DECIMAL` columns, MySQL performs operations with a precision of 64 decimal digits, which should solve most common in-accuracy problems.

The following example demonstrates the problem using `DOUBLE`. It shows that are calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2
6	-51.4	0

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row — the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

i	a	b
6	-51.4	0

1 row in set (0.00 sec)

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4 | 7.4 |
| 4 | 15.4 | 15.4 |
| 5 | 7.2 | 7.2 |
+-----+-----+-----+
5 rows in set (0.03 sec)
```

A.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 7.2.1, "Optimizing Queries with EXPLAIN"](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 13.5.2.1, "ANALYZE TABLE Syntax"](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index. See [Section 13.2.7, "SELECT Syntax"](#).

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful.

- Global and table-level `STRAIGHT_JOIN`. See [Section 13.2.7, "SELECT Syntax"](#).
- You can tune global or thread-specific system variables. For example, Start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.2.3, "System Variables"](#).

A.7. Table Definition-Related Issues

A.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

A.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the following statements returns columns in the order `col_name1, col_name2, col_name3`, whereas the second returns them in the order `col_name1, col_name3, col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

```
mysql> INSERT INTO new_table
-> SELECT columns-in-new-order FROM old_table;
```

3. Drop or rename `old_table`.
4. Rename the new table to the original name:

```
mysql> ALTER TABLE new_table RENAME old_table;
```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which

columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

A.7.3. TEMPORARY TABLE Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 6.8, “Replication Features and Known Problems”](#), for more information.

A.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.13, “Operating System-Specific Notes”](#), and [Appendix E, *Porting to Other Systems*](#).

A.8.1. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

- MySQL Cluster fails to recover from an out-of-disk failure when using disk data. ([Bug#17614](http://bugs.mysql.com/17614) [<http://bugs.mysql.com/17614>])
- If you compare a `NULL` value to a subquery using `ALL/ANY/SOME` and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE`. This will be fixed in MySQL 5.1.
- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.

- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log filenames are based on the server hostname (if you don't specify a filename with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your hostname to something else. Another option is to rename the old files to reflect your hostname change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See [Section 5.2.2, “Command Options”](#).
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` command. See [Section 8.9, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use `'_'` or `'%'` with `ESCAPE` in `LIKE ... ESCAPE`.
- If you have a `DECIMAL` column in which the same number is stored in different formats (for example, `+01.00`, `1.00`, `01.00`), `GROUP BY` may regard each value as a different value.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See [Section 2.9.5, “MIT-pthreads Notes”](#).
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use `--log` extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement incre-

ments `KEY` by 2, not 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;  
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads  
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id  
FROM band_downloads,band_mp3  
WHERE band_downloads.userid = 9  
AND band_mp3.id = band_downloads.mp3id  
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

Appendix B. Error Codes and Messages

This appendix lists the errors that may appear when you call MySQL from any host language. The first list displays server error messages. The second list displays client program messages.

B.1. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;  
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error value (1146). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value ('42S02'). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysql_d_error.h` and `include/mysql_d_ename.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 1000 SQLSTATE: HY000 (ER_HASHCHK)
Message: hashchk
- Error: 1001 SQLSTATE: HY000 (ER_NISAMCHK)
Message: isamchk
- Error: 1002 SQLSTATE: HY000 (ER_NO)
Message: NO
- Error: 1003 SQLSTATE: HY000 (ER_YES)

Message: YES

- Error: 1004 SQLSTATE: HY000 (ER_CANT_CREATE_FILE)
Message: Can't create file '%s' (errno: %d)
- Error: 1005 SQLSTATE: HY000 (ER_CANT_CREATE_TABLE)
Message: Can't create table '%s' (errno: %d)
- Error: 1006 SQLSTATE: HY000 (ER_CANT_CREATE_DB)
Message: Can't create database '%s' (errno: %d)
- Error: 1007 SQLSTATE: HY000 (ER_DB_CREATE_EXISTS)
Message: Can't create database '%s'; database exists
- Error: 1008 SQLSTATE: HY000 (ER_DB_DROP_EXISTS)
Message: Can't drop database '%s'; database doesn't exist
- Error: 1009 SQLSTATE: HY000 (ER_DB_DROP_DELETE)
Message: Error dropping database (can't delete '%s', errno: %d)
- Error: 1010 SQLSTATE: HY000 (ER_DB_DROP_RMDIR)
Message: Error dropping database (can't rmdir '%s', errno: %d)
- Error: 1011 SQLSTATE: HY000 (ER_CANT_DELETE_FILE)
Message: Error on delete of '%s' (errno: %d)
- Error: 1012 SQLSTATE: HY000 (ER_CANT_FIND_SYSTEM_REC)
Message: Can't read record in system table
- Error: 1013 SQLSTATE: HY000 (ER_CANT_GET_STAT)
Message: Can't get status of '%s' (errno: %d)
- Error: 1014 SQLSTATE: HY000 (ER_CANT_GET_WD)
Message: Can't get working directory (errno: %d)
- Error: 1015 SQLSTATE: HY000 (ER_CANT_LOCK)
Message: Can't lock file (errno: %d)
- Error: 1016 SQLSTATE: HY000 (ER_CANT_OPEN_FILE)
Message: Can't open file: '%s' (errno: %d)
- Error: 1017 SQLSTATE: HY000 (ER_FILE_NOT_FOUND)
Message: Can't find file: '%s' (errno: %d)
- Error: 1018 SQLSTATE: HY000 (ER_CANT_READ_DIR)

- Message: Can't read dir of '%s' (errno: %d)
- Error: 1019 SQLSTATE: HY000 (ER_CANT_SET_WD)
Message: Can't change dir to '%s' (errno: %d)
- Error: 1020 SQLSTATE: HY000 (ER_CHECKREAD)
Message: Record has changed since last read in table '%s'
- Error: 1021 SQLSTATE: HY000 (ER_DISK_FULL)
Message: Disk full (%s); waiting for someone to free some space...
- Error: 1022 SQLSTATE: 23000 (ER_DUP_KEY)
Message: Can't write; duplicate key in table '%s'
- Error: 1023 SQLSTATE: HY000 (ER_ERROR_ON_CLOSE)
Message: Error on close of '%s' (errno: %d)
- Error: 1024 SQLSTATE: HY000 (ER_ERROR_ON_READ)
Message: Error reading file '%s' (errno: %d)
- Error: 1025 SQLSTATE: HY000 (ER_ERROR_ON_RENAME)
Message: Error on rename of '%s' to '%s' (errno: %d)
- Error: 1026 SQLSTATE: HY000 (ER_ERROR_ON_WRITE)
Message: Error writing file '%s' (errno: %d)
- Error: 1027 SQLSTATE: HY000 (ER_FILE_USED)
Message: '%s' is locked against change
- Error: 1028 SQLSTATE: HY000 (ER_FILSORT_ABORT)
Message: Sort aborted
- Error: 1029 SQLSTATE: HY000 (ER_FORM_NOT_FOUND)
Message: View '%s' doesn't exist for '%s'
- Error: 1030 SQLSTATE: HY000 (ER_GET_ERRNO)
Message: Got error %d from storage engine
- Error: 1031 SQLSTATE: HY000 (ER_ILLEGAL_HA)
Message: Table storage engine for '%s' doesn't have this option
- Error: 1032 SQLSTATE: HY000 (ER_KEY_NOT_FOUND)
Message: Can't find record in '%s'
- Error: 1033 SQLSTATE: HY000 (ER_NOT_FORM_FILE)

Message: Incorrect information in file: '%s'

- Error: 1034 SQLSTATE: HY000 (ER_NOT_KEYFILE)

Message: Incorrect key file for table '%s'; try to repair it

- Error: 1035 SQLSTATE: HY000 (ER_OLD_KEYFILE)

Message: Old key file for table '%s'; repair it!

- Error: 1036 SQLSTATE: HY000 (ER_OPEN_AS_READONLY)

Message: Table '%s' is read only

- Error: 1037 SQLSTATE: HY001 (ER_OUTOFMEMORY)

Message: Out of memory; restart server and try again (needed %d bytes)

- Error: 1038 SQLSTATE: HY001 (ER_OUT_OF_SORTMEMORY)

Message: Out of sort memory; increase server sort buffer size

- Error: 1039 SQLSTATE: HY000 (ER_UNEXPECTED_EOF)

Message: Unexpected EOF found when reading file '%s' (errno: %d)

- Error: 1040 SQLSTATE: 08004 (ER_CON_COUNT_ERROR)

Message: Too many connections

- Error: 1041 SQLSTATE: HY000 (ER_OUT_OF_RESOURCES)

Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error: 1042 SQLSTATE: 08S01 (ER_BAD_HOST_ERROR)

Message: Can't get hostname for your address

- Error: 1043 SQLSTATE: 08S01 (ER_HANDSHAKE_ERROR)

Message: Bad handshake

- Error: 1044 SQLSTATE: 42000 (ER_DBACCESS_DENIED_ERROR)

Message: Access denied for user '%s'@'%s' to database '%s'

- Error: 1045 SQLSTATE: 28000 (ER_ACCESS_DENIED_ERROR)

Message: Access denied for user '%s'@'%s' (using password: %s)

- Error: 1046 SQLSTATE: 3D000 (ER_NO_DB_ERROR)

Message: No database selected

- Error: 1047 SQLSTATE: 08S01 (ER_UNKNOWN_COM_ERROR)

Message: Unknown command

- Error: 1048 SQLSTATE: 23000 (ER_BAD_NULL_ERROR)
Message: Column '%s' cannot be null
- Error: 1049 SQLSTATE: 42000 (ER_BAD_DB_ERROR)
Message: Unknown database '%s'
- Error: 1050 SQLSTATE: 42S01 (ER_TABLE_EXISTS_ERROR)
Message: Table '%s' already exists
- Error: 1051 SQLSTATE: 42S02 (ER_BAD_TABLE_ERROR)
Message: Unknown table '%s'
- Error: 1052 SQLSTATE: 23000 (ER_NON_UNIQ_ERROR)
Message: Column '%s' in %s is ambiguous
- Error: 1053 SQLSTATE: 08S01 (ER_SERVER_SHUTDOWN)
Message: Server shutdown in progress
- Error: 1054 SQLSTATE: 42S22 (ER_BAD_FIELD_ERROR)
Message: Unknown column '%s' in '%s'
- Error: 1055 SQLSTATE: 42000 (ER_WRONG_FIELD_WITH_GROUP)
Message: '%s' isn't in GROUP BY
- Error: 1056 SQLSTATE: 42000 (ER_WRONG_GROUP_FIELD)
Message: Can't group on '%s'

- Error: [1109 SQLSTATE: 42S02 \(ER_UNKNOWN_TABLE\)](#)
Message: Unknown table '%s' in %s
- Error: [1110 SQLSTATE: 42000 \(ER_FIELD_SPECIFIED_TWICE\)](#)
Message: Column '%s' specified twice
- Error: [1111 SQLSTATE: HY000 \(ER_INVALID_GROUP_FUNC_USE\)](#)
Message: Invalid use of group function
- Error: [1112 SQLSTATE: 42000 \(ER_UNSUPPORTED_EXTENSION\)](#)
Message: Table '%s' uses an extension that doesn't exist in this MySQL version
- Error: [1113 SQLSTATE: 42000 \(ER_TABLE_MUST_HAVE_COLUMNS\)](#)
Message: A table must have at least 1 column
- Error: [1114 SQLSTATE: HY000 \(ER_RECORD_FILE_FULL\)](#)
Message: The table '%s' is full
- Error: [1115 SQLSTATE: 42000 \(ER_UNKNOWN_CHARACTER_SET\)](#)
Message: Unknown character set: '%s'
- Error: [1116 SQLSTATE: HY000 \(ER_TOO_MANY_TABLES\)](#)
Message: Too many tables; MySQL can only use %d tables in a join
- Error: [1117 SQLSTATE: HY000 \(ER_TOO_MANY_FIELDS\)](#)
Message: Too many columns
- Error: [1118 SQLSTATE: 42000 \(ER_TOO_BIG_ROWSIZE\)](#)
Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. You have to change some columns to TEXT or BLOBs
- Error: [1119 SQLSTATE: HY000 \(ER_STACK_OVERRUN\)](#)
Message: Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld -O thread_stack=#' to specify a bigger stack if needed
- Error: [1120 SQLSTATE: 42000 \(ER_WRONG_OUTER_JOIN\)](#)
Message: Cross dependency found in OUTER JOIN; examine your ON conditions
- Error: [1121 SQLSTATE: 42000 \(ER_NULL_COLUMN_IN_INDEX\)](#)
Message: Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler
- Error: [1122 SQLSTATE: HY000 \(ER_CANT_FIND_UDF\)](#)

Message: Can't load function '%s'

- Error: 1123 SQLSTATE: HY000 (ER_CANT_INITIALIZE_UDF)

Message: Can't initialize function '%s'; %s

- Error: 1124 SQLSTATE: HY000 (ER_UDF_NO_PATHS)

Message: No paths allowed for shared library

- Error: 1125 SQLSTATE: HY000 (ER_UDF_EXISTS)

Message: Function '%s' already exists

- Error: 1126 SQLSTATE: HY000 (ER_CANT_OPEN_LIBRARY)

Message: Can't open shared library '%s' (errno: %d %s)

- Error: 1127 SQLSTATE: HY000 (ER_CANT_FIND_DL_ENTRY)

Message: Can't find symbol '%s' in library

- Error: 1128 SQLSTATE: HY000 (ER_FUNCTION_NOT_DEFINED)

Message: Function '%s' is not defined

- Error: 1129 SQLSTATE: HY000 (ER_HOST_IS_BLOCKED)

Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER_HOST_NOT_PRIVILEGED)

Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER_PASSWORD_ANONYMOUS_USER)

Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER_PASSWORD_NOT_ALLOWED)

Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER_PASSWORD_NO_MATCH)

Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER_UPDATE_INFO)

Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER_CANT_CREATE_THREAD)

Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT_ON_ROW)

Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER_CANT_REOPEN_TABLE)

Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 22004 (ER_INVALID_USE_OF_NULL)

Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER_REGEXP_ERROR)

Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER_MIX_OF_GROUP_FUNC_AND_FIELDS)

Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER_NONEXISTING_GRANT)

Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER_TABLEACCESS_DENIED_ERROR)

Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER_COLUMNACCESS_DENIED_ERROR)

Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER_ILLEGAL_GRANT_FOR_TABLE)

Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used

- Error: 1145 SQLSTATE: 42000 (ER_GRANT_WRONG_HOST_OR_USER)

Message: The host or user argument to GRANT is too long

- Error: 1146 SQLSTATE: 42S02 (ER_NO_SUCH_TABLE)

Message: Table '%s.%s' doesn't exist

- Error: 1147 SQLSTATE: 42000 (ER_NONEXISTING_TABLE_GRANT)

Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- Error: 1148 SQLSTATE: 42000 (ER_NOT_ALLOWED_COMMAND)

Message: The used command is not allowed with this MySQL version

- Error: 1149 SQLSTATE: 42000 (ER_SYNTAX_ERROR)

Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- Error: 1150 SQLSTATE: HY000 (ER_DELAYED_CANT_CHANGE_LOCK)

Message: Delayed insert thread couldn't get requested lock for table %s

- Error: 1151 SQLSTATE: HY000 (ER_TOO_MANY_DELAYED_THREADS)

Message: Too many delayed threads in use

- Error: 1152 SQLSTATE: 08S01 (ER_ABORTING_CONNECTION)

Message: Aborted connection %ld to db: '%s' user: '%s' (%s)

- Error: 1153 SQLSTATE: 08S01 (ER_NET_PACKET_TOO_LARGE)

Message: Got a packet bigger than 'max_allowed_packet' bytes

- Error: 1154 SQLSTATE: 08S01 (ER_NET_READ_ERROR_FROM_PIPE)

Message: Got a read error from the connection pipe

- Error: 1155 SQLSTATE: 08S01 (ER_NET_FCNTL_ERROR)

Message: Got an error from fcntl()

- Error: 1156 SQLSTATE: 08S01 (ER_NET_PACKETS_OUT_OF_ORDER)

Message: Got packets out of order

- Error: 1157 SQLSTATE: 08S01 (ER_NET_UNCOMPRESS_ERROR)

Message: Couldn't uncompress communication packet

- Error: 1158 SQLSTATE: 08S01 (ER_NET_READ_ERROR)

Message: Got an error reading communication packets

- Error: 1159 SQLSTATE: 08S01 (ER_NET_READ_INTERRUPTED)

Message: Got timeout reading communication packets

- Error: 1160 SQLSTATE: 08S01 (ER_NET_ERROR_ON_WRITE)

Message: Got an error writing communication packets

- Error: 1161 SQLSTATE: 08S01 (ER_NET_WRITE_INTERRUPTED)

Message: Got timeout writing communication packets

- Error: 1162 SQLSTATE: 42000 (ER_TOO_LONG_STRING)

Message: Result string is longer than 'max_allowed_packet' bytes

- Error: 1163 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_BLOB)

Message: The used table type doesn't support BLOB/TEXT columns

- Error: 1164 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_AUTO_INCREMENT)

Message: The used table type doesn't support AUTO_INCREMENT columns

- Error: 1165 SQLSTATE: HY000 (ER_DELAYED_INSERT_TABLE_LOCKED)

Message: INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES

- Error: 1166 SQLSTATE: 42000 (ER_WRONG_COLUMN_NAME)

Message: Incorrect column name '%s'

- Error: 1167 SQLSTATE: 42000 (ER_WRONG_KEY_COLUMN)

Message: The used storage engine can't index column '%s'

- Error: 1168 SQLSTATE: HY000 (ER_WRONG_MRG_TABLE)

Message: Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist

- Error: 1169 SQLSTATE: 23000 (ER_DUP_UNIQUE)

Message: Can't write, because of unique constraint, to table '%s'

- Error: 1170 SQLSTATE: 42000 (ER_BLOB_KEY_WITHOUT_LENGTH)

Message: BLOB/TEXT column '%s' used in key specification without a key length

- Error: 1171 SQLSTATE: 42000 (ER_PRIMARY_CANT_HAVE_NULL)

Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead

- Error: 1172 SQLSTATE: 42000 (ER_TOO_MANY_ROWS)

Message: Result consisted of more than one row

- Error: 1173 SQLSTATE: 42000 (ER_REQUIRES_PRIMARY_KEY)

Message: This table type requires a primary key

- Error: 1174 SQLSTATE: HY000 (ER_NO_RAID_COMPILED)

Message: This version of MySQL is not compiled with RAID support

- Error: 1175 SQLSTATE: HY000 (ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE)

Message: You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column

- Error: 1176 SQLSTATE: 42000 (ER_KEY_DOES_NOT_EXISTS)

Message: Key '%s' doesn't exist in table '%s'

- Error: 1177 SQLSTATE: 42000 (ER_CHECK_NO_SUCH_TABLE)

Message: Can't open table

- Error: 1178 SQLSTATE: 42000 (ER_CHECK_NOT_IMPLEMENTED)

Message: The storage engine for the table doesn't support %s

- Error: 1179 SQLSTATE: 25000 (ER_CANT_DO_THIS_DURING_AN_TRANSACTION)

- Message: You are not allowed to execute this command in a transaction
- Error: 1180 SQLSTATE: HY000 (ER_ERROR_DURING_COMMIT)
Message: Got error %d during COMMIT
 - Error: 1181 SQLSTATE: HY000 (ER_ERROR_DURING_ROLLBACK)
Message: Got error %d during ROLLBACK
 - Error: 1182 SQLSTATE: HY000 (ER_ERROR_DURING_FLUSH_LOGS)
Message: Got error %d during FLUSH_LOGS
 - Error: 1183 SQLSTATE: HY000 (ER_ERROR_DURING_CHECKPOINT)
Message: Got error %d during CHECKPOINT
 - Error: 1184 SQLSTATE: 08S01 (ER_NEW_ABORTING_CONNECTION)
Message: Aborted connection %ld to db: '%s' user: '%s' host: '%s' (%s)
 - Error: 1185 SQLSTATE: HY000 (ER_DUMP_NOT_IMPLEMENTED)
Message: The storage engine for the table does not support binary table dump
 - Error: 1186 SQLSTATE: HY000 (ER_FLUSH_MASTER_BINLOG_CLOSED)
Message: Binlog closed, cannot RESET MASTER
 - Error: 1187 SQLSTATE: HY000 (ER_INDEX_REBUILD)
Message: Failed rebuilding the index of dumped table '%s'
 - Error: 1188 SQLSTATE: HY000 (ER_MASTER)
Message: Error from master: '%s'
 - Error: 1189 SQLSTATE: 08S01 (ER_MASTER_NET_READ)
Message: Net error reading from master
 - Error: 1190 SQLSTATE: 08S01 (ER_MASTER_NET_WRITE)
Message: Net error writing to master
 - Error: 1191 SQLSTATE: HY000 (ER_FT_MATCHING_KEY_NOT_FOUND)
Message: Can't find FULLTEXT index matching the column list
 - Error: 1192 SQLSTATE: HY000 (ER_LOCK_OR_ACTIVE_TRANSACTION)
Message: Can't execute the given command because you have active locked tables or an active transaction
 - Error: 1193 SQLSTATE: HY000 (ER_UNKNOWN_SYSTEM_VARIABLE)
Message: Unknown system variable '%s'

- Error: 1194 SQLSTATE: HY000 (ER_CRASHED_ON_USAGE)
Message: Table '%s' is marked as crashed and should be repaired
- Error: 1195 SQLSTATE: HY000 (ER_CRASHED_ON_REPAIR)
Message: Table '%s' is marked as crashed and last (automatic?) repair failed
- Error: 1196 SQLSTATE: HY000 (ER_WARNING_NOT_COMPLETE_ROLLBACK)
Message: Some non-transactional changed tables couldn't be rolled back
- Error: 1197 SQLSTATE: HY000 (ER_TRANS_CACHE_FULL)
Message: Multi-statement transaction required more than 'max_binlog_cache_size' bytes of storage; increase this mysqld variable and try again
- Error: 1198 SQLSTATE: HY000 (ER_SLAVE_MUST_STOP)
Message: This operation cannot be performed with a running slave; run STOP SLAVE first
- Error: 1199 SQLSTATE: HY000 (ER_SLAVE_NOT_RUNNING)
Message: This operation requires a running slave; configure slave and do START SLAVE
- Error: 1200 SQLSTATE: HY000 (ER_BAD_SLAVE)
Message: The server is not configured as slave; fix in config file or with CHANGE MASTER TO
- Error: 1201 SQLSTATE: HY000 (ER_MASTER_INFO)
Message: Could not initialize master info structure; more error messages can be found in the MySQL error log
- Error: 1202 SQLSTATE: HY000 (ER_SLAVE_THREAD)
Message: Could not create slave thread; check system resources
- Error: 1203 SQLSTATE: 42000 (ER_TOO_MANY_USER_CONNECTIONS)
Message: User %s already has more than 'max_user_connections' active connections
- Error: 1204 SQLSTATE: HY000 (ER_SET_CONSTANTS_ONLY)
Message: You may only use constant expressions with SET
- Error: 1205 SQLSTATE: HY000 (ER_LOCK_WAIT_TIMEOUT)
Message: Lock wait timeout exceeded; try restarting transaction
- Error: 1206 SQLSTATE: HY000 (ER_LOCK_TABLE_FULL)
Message: The total number of locks exceeds the lock table size
- Error: 1207 SQLSTATE: 25000 (ER_READ_ONLY_TRANSACTION)
Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction
- Error: 1208 SQLSTATE: HY000 (ER_DROP_DB_WITH_READ_LOCK)

Message: DROP DATABASE not allowed while thread is holding global read lock

- Error: 1209 SQLSTATE: HY000 (ER_CREATE_DB_WITH_READ_LOCK)

Message: CREATE DATABASE not allowed while thread is holding global read lock

- Error: 1210 SQLSTATE: HY000 (ER_WRONG_ARGUMENTS)

Message: Incorrect arguments to %s

- Error: 1211 SQLSTATE: 42000 (ER_NO_PERMISSION_TO_CREATE_USER)

Message: '%s'@'%s' is not allowed to create new users

- Error: 1212 SQLSTATE: HY000 (ER_UNION_TABLES_IN_DIFFERENT_DIR)

Message: Incorrect table definition; all MERGE tables must be in the same database

- Error: 1213 SQLSTATE: 40001 (ER_LOCK_DEADLOCK)

Message: Deadlock found when trying to get lock; try restarting transaction

- Error: 1214 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_FT)

Message: The used table type doesn't support FULLTEXT indexes

- Error: 1215 SQLSTATE: HY000 (ER_CANNOT_ADD_FOREIGN)

Message: Cannot add foreign key constraint

- Error: 1216 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW)

Message: Cannot add or update a child row: a foreign key constraint fails

- Error: 1217 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED)

Message: Cannot delete or update a parent row: a foreign key constraint fails

- Error: 1218 SQLSTATE: 08S01 (ER_CONNECT_TO_MASTER)

Message: Error connecting to master: %s

- Error: 1219 SQLSTATE: HY000 (ER_QUERY_ON_MASTER)

Message: Error running query on master: %s

- Error: 1220 SQLSTATE: HY000 (ER_ERROR_WHEN_EXECUTING_COMMAND)

Message: Error when executing command %s: %s

- Error: 1221 SQLSTATE: HY000 (ER_WRONG_USAGE)

Message: Incorrect usage of %s and %s

- Error: 1222 SQLSTATE: 21000 (ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT)

Message: The used SELECT statements have a different number of columns

- Error: 1223 SQLSTATE: HY000 (ER_CANT_UPDATE_WITH_READLOCK)

Message: Can't execute the query because you have a conflicting read lock

- Error: 1224 SQLSTATE: HY000 (ER_MIXING_NOT_ALLOWED)

Message: Mixing of transactional and non-transactional tables is disabled

- Error: 1225 SQLSTATE: HY000 (ER_DUP_ARGUMENT)

Message: Option '%s' used twice in statement

- Error: 1226 SQLSTATE: 42000 (ER_USER_LIMIT_REACHED)

Message: User '%s' has exceeded the '%s' resource (current value: %ld)

- Error: 1227 SQLSTATE: 42000 (ER_SPECIFIC_ACCESS_DENIED_ERROR)

Message: Access denied; you need the %s privilege for this operation

- Error: 1228 SQLSTATE: HY000 (ER_LOCAL_VARIABLE)

Message: Variable '%s' is a SESSION variable and can't be used with SET GLOBAL

- Error: 1229 SQLSTATE: HY000 (ER_GLOBAL_VARIABLE)

Message: Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL

- Error: 1230 SQLSTATE: 42000 (ER_NO_DEFAULT)

Message: Variable '%s' doesn't have a default value

- Error: 1231 SQLSTATE: 42000 (ER_WRONG_VALUE_FOR_VAR)

Message: Variable '%s' can't be set to the value of '%s'

- Error: 1232 SQLSTATE: 42000 (ER_WRONG_TYPE_FOR_VAR)

Message: Incorrect argument type to variable '%s'

- Error: 1233 SQLSTATE: HY000 (ER_VAR_CANT_BE_READ)

Message: Variable '%s' can only be set, not read

- Error: 1234 SQLSTATE: 42000 (ER_CANT_USE_OPTION_HERE)

Message: Incorrect usage/placement of '%s'

- Error: 1235 SQLSTATE: 42000 (ER_NOT_SUPPORTED_YET)

Message: This version of MySQL doesn't yet support '%s'

- Error: 1236 SQLSTATE: HY000 (ER_MASTER_FATAL_ERROR_READING_BINLOG)

Message: Got fatal error %d: '%s' from master when reading data from binary log

- Error: 1237 SQLSTATE: HY000 (ER_SLAVE_IGNORED_TABLE)

Message: Slave SQL thread ignored the query because of replicate-***-table rules

- Error: 1238 SQLSTATE: HY000 (ER_INCORRECT_GLOBAL_LOCAL_VAR)

Message: Variable '%s' is a %s variable

- Error: 1239 SQLSTATE: 42000 (ER_WRONG_FK_DEF)

Message: Incorrect foreign key definition for '%s': %s

- Error: 1422 SQLSTATE: HY000 (ER_COMMIT_NOT_ALLOWED_IN_SF_OR_TRG)
Message: Explicit or implicit commit is not allowed in stored function or trigger.
- Error: 1423 SQLSTATE: HY000 (ER_NO_DEFAULT_FOR_VIEW_FIELD)
Message: Field of view '%s.%s' underlying table doesn't have a default value
- Error: 1424 SQLSTATE: HY000 (ER_SP_NO_RECURSION)
Message: Recursive stored functions and triggers are not allowed.
- Error: 1425 SQLSTATE: 42000 (ER_TOO_BIG_SCALE)
Message: Too big scale %d specified for column '%s'. Maximum is %d.
- Error: 1426 SQLSTATE: 42000 (ER_TOO_BIG_PRECISION)
Message: Too big precision %d specified for column '%s'. Maximum is %d.
- Error: 1427 SQLSTATE: 42000 (ER_M_BIGGER_THAN_D)
Message: For float(M,D), double(M,D) or decimal(M,D), M must be >= D (column '%s').

- Error: 1428 SQLSTATE: HY000 (ER_WRONG_LOCK_OF_SYSTEM_TABLE)
Message: You can't combine write-locking of system '%s.%s' table with other tables
- Error: 1429 SQLSTATE: HY000 (ER_CONNECT_TO_FOREIGN_DATA_SOURCE)
Message: Unable to connect to foreign data source: %s
- Error: 1430 SQLSTATE: HY000 (ER_QUERY_ON_FOREIGN_DATA_SOURCE)
Message: There was a problem processing the query on the foreign data source. Data source error: %-.64
- Error: 1431 SQLSTATE: HY000 (ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST)
Message: The foreign data source you are trying to reference does not exist. Data source error: %s
- Error: 1432 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE)
Message: Can't create federated table. The data source connection string '%s' is not in the correct format
- Error: 1433 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID)
Message: The data source connection string '%s' is not in the correct format
- Error: 1434 SQLSTATE: HY000 (ER_CANT_CREATE_FEDERATED_TABLE)
Message: Can't create federated table. Foreign data src error: %s
- Error: 1435 SQLSTATE: HY000 (ER_TRG_IN_WRONG_SCHEMA)
Message: Trigger in wrong schema
- Error: 1436 SQLSTATE: HY000 (ER_STACK_OVERRUN_NEED_MORE)
Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld -O thread_stack=#' to specify a bigger stack.
- Error: 1437 SQLSTATE: 42000 (ER_TOO_LONG_BODY)
Message: Routine body for '%s' is too long
- Error: 1438 SQLSTATE: HY000 (ER_WARN_CANT_DROP_DEFAULT_KEYCACHE)
Message: Cannot drop default keycache
- Error: 1439 SQLSTATE: 42000 (ER_TOO_BIG_DISPLAYWIDTH)
Message: Display width out of range for column '%s' (max = %d)
- Error: 1440 SQLSTATE: XAE08 (ER_XAER_DUPID)
Message: XAER_DUPID: The XID already exists
- Error: 1441 SQLSTATE: 22008 (ER_DATETIME_FUNCTION_OVERFLOW)
Message: Datetime function: %s field overflow
- Error: 1442 SQLSTATE: HY000 (ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG)

Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.

- Error: 1443 SQLSTATE: HY000 (ER_VIEW_PREVENT_UPDATE)

Message: The definition of table '%s' prevents operation %s on table '%s'.

- Error: 1444 SQLSTATE: HY000 (ER_PS_NO_RECURSION)

Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner

- Error: 1445 SQLSTATE: HY000 (ER_SP_CANT_SET_AUTOCOMMIT)

Message: Not allowed to set autocommit from a stored function or trigger

- Error: 1446 SQLSTATE: HY000 (ER_MALFORMED_DEFINER)

Message: Definer is not fully qualified

- Error: 1447 SQLSTATE: HY000 (ER_VIEW_FRM_NO_USER)

Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!

- Error: 1448 SQLSTATE: HY000 (ER_VIEW_OTHER_USER)

Message: You need the SUPER privilege for creation view with '%s'@'%s' definer

- Error: 1449 SQLSTATE: HY000 (ER_NO_SUCH_USER)

Message: There is no '%s'@'%s' registered

- Error: 1450 SQLSTATE: HY000 (ER_FORBID_SCHEMA_CHANGE)

Message: Changing schema from '%s' to '%s' is not allowed.

- Error: 1451 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED_2)

Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)

- Error: 1452 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW_2)

Message: Cannot add or update a child row: a foreign key constraint fails (%s)

- Error: 1453 SQLSTATE: 42000 (ER_SP_BAD_VAR_SHADOW)

Message: Variable '%s' must be quoted with `...`, or renamed

- Error: 1454 SQLSTATE: HY000 (ER_TRG_NO_DEFINER)

Message: No definer attribute for trigger '%s'.'%s'. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.

- Error: 1455 SQLSTATE: HY000 (ER_OLD_FILE_FORMAT)

Message: '%s' has an old format, you should re-create the '%s' object(s)

- Error: 1456 SQLSTATE: HY000 (ER_SP_RECURSION_LIMIT)

Message: Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s

- Error: 1457 SQLSTATE: HY000 (ER_SP_PROC_TABLE_CORRUPT)

Message: Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)

- Error: 1458 SQLSTATE: 42000 (ER_SP_WRONG_NAME)

Message: Incorrect routine name '%s'

- Error: 1459 SQLSTATE: HY000 (ER_TABLE_NEEDS_UPGRADE)

Message: Table upgrade required. Please do "REPAIR TABLE `%s`" to fix it!

- Error: 1460 SQLSTATE: 42000 (ER_SP_NO_AGGREGATE)

Message: AGGREGATE is not supported for stored functions

- Error: 1461 SQLSTATE: 42000 (ER_MAX_PREPARED_STMT_COUNT_REACHED)

Message: Can't create more than max_prepared_stmt_count statements (current value: %lu)

- Error: 1462 SQLSTATE: HY000 (ER_VIEW_RECURSIVE)

Message: `%s`.`%s` contains view recursion

- Error: 1463 SQLSTATE: 42000 (ER_NON_GROUPING_FIELD_USED)

Message: non-grouping field '%s' is used in %s clause

- Error: 1464 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_SPKEYS)

Message: The used table type doesn't support SPATIAL indexes

- Error: 1465 SQLSTATE: HY000 (ER_ILLEGAL HA_CREATE_OPTION)

Message: Table storage engine '%s' does not support the create option '%s'

- Error: 1466 SQLSTATE: HY000 (ER_PARTITION_REQUIRES_VALUES_ERROR)

Message: %s PARTITIONING requires definition of VALUES %s for each partition

- Error: 1467 SQLSTATE: HY000 (ER_PARTITION_WRONG_VALUES_ERROR)

Message: Only %s PARTITIONING can use VALUES %s in partition definition

- Error: 1468 SQLSTATE: HY000 (ER_PARTITION_MAXVALUE_ERROR)

Message: MAXVALUE can only be used in last partition definition

- Error: 1469 SQLSTATE: HY000 (ER_PARTITION_SUBPARTITION_ERROR)

Message: Subpartitions can only be hash partitions and by key

- Error: 1470 SQLSTATE: HY000 (ER_PARTITION_SUBPART_MIX_ERROR)

Message: Must define subpartitions on all partitions if on one partition

- Error: 1471 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_PART_ERROR)
Message: Wrong number of partitions defined, mismatch with previous setting
- Error: 1472 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_SUBPART_ERROR)
Message: Wrong number of subpartitions defined, mismatch with previous setting
- Error: 1473 SQLSTATE: HY000 (ER_CONST_EXPR_IN_PARTITION_FUNC_ERROR)
Message: Constant/Random expression in (sub)partitioning function is not allowed
- Error: 1474 SQLSTATE: HY000 (ER_NO_CONST_EXPR_IN_RANGE_OR_LIST_ERROR)
Message: Expression in RANGE/LIST VALUES must be constant
- Error: 1475 SQLSTATE: HY000 (ER_FIELD_NOT_FOUND_PART_ERROR)
Message: Field in list of fields for partition function not found in table
- Error: 1476 SQLSTATE: HY000 (ER_LIST_OF_FIELDS_ONLY_IN_HASH_ERROR)
Message: List of fields is only allowed in KEY partitions
- Error: 1477 SQLSTATE: HY000 (ER_INCONSISTENT_PARTITION_INFO_ERROR)
Message: The partition info in the frm file is not consistent with what can be written into the frm file
- Error: 1478 SQLSTATE: HY000 (ER_PARTITION_FUNC_NOT_ALLOWED_ERROR)
Message: The %s function returns the wrong type
- Error: 1479 SQLSTATE: HY000 (ER_PARTITIONS_MUST_BE_DEFINED_ERROR)
Message: For %s partitions each partition must be defined
- Error: 1480 SQLSTATE: HY000 (ER_RANGE_NOT_INCREASING_ERROR)
Message: VALUES LESS THAN value must be strictly increasing for each partition
- Error: 1481 SQLSTATE: HY000 (ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR)
Message: VALUES value must be of same type as partition function
- Error: 1482 SQLSTATE: HY000 (ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR)
Message: Multiple definition of same constant in list partitioning
- Error: 1483 SQLSTATE: HY000 (ER_PARTITION_ENTRY_ERROR)
Message: Partitioning can not be used stand-alone in query
- Error: 1484 SQLSTATE: HY000 (ER_MIX_HANDLER_ERROR)
Message: The mix of handlers in the partitions is not allowed in this version of MySQL
- Error: 1485 SQLSTATE: HY000 (ER_PARTITION_NOT_DEFINED_ERROR)
Message: For the partitioned engine it is necessary to define all %s

- Error: 1486 SQLSTATE: HY000 (ER_TOO_MANY_PARTITIONS_ERROR)
Message: Too many partitions (including subpartitions) were defined
- Error: 1487 SQLSTATE: HY000 (ER_SUBPARTITION_ERROR)
Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
- Error: 1488 SQLSTATE: HY000 (ER_CANT_CREATE_HANDLER_FILE)
Message: Failed to create specific handler file
- Error: 1489 SQLSTATE: HY000 (ER_BLOB_FIELD_IN_PART_FUNC_ERROR)
Message: A BLOB field is not allowed in partition function
- Error: 1490 SQLSTATE: HY000 (ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF)
Message: A %s must include all columns in the table's partitioning function
- Error: 1491 SQLSTATE: HY000 (ER_NO_PARTS_ERROR)
Message: Number of %s = 0 is not an allowed value
- Error: 1492 SQLSTATE: HY000 (ER_PARTITION_MGMT_ON_NONPARTITIONED)
Message: Partition management on a not partitioned table is not possible
- Error: 1493 SQLSTATE: HY000 (ER_FOREIGN_KEY_ON_PARTITIONED)
Message: Foreign key condition is not yet supported in conjunction with partitioning
- Error: 1494 SQLSTATE: HY000 (ER_DROP_PARTITION_NON_EXISTENT)
Message: Error in list of partitions to %s
- Error: 1495 SQLSTATE: HY000 (ER_DROP_LAST_PARTITION)
Message: Cannot remove all partitions, use DROP TABLE instead
- Error: 1496 SQLSTATE: HY000 (ER_COALESCE_ONLY_ON_HASH_PARTITION)
Message: COALESCE PARTITION can only be used on HASH/KEY partitions
- Error: 1497 SQLSTATE: HY000 (ER_REORG_HASH_ONLY_ON_SAME_NO)
Message: REORGANISE PARTITION can only be used to reorganise partitions not to change their numbers
- Error: 1498 SQLSTATE: HY000 (ER_REORG_NO_PARAM_ERROR)
Message: REORGANISE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONS
- Error: 1499 SQLSTATE: HY000 (ER_ONLY_ON_RANGE_LIST_PARTITION)
Message: %s PARTITION can only be used on RANGE/LIST partitions
- Error: 1500 SQLSTATE: HY000 (ER_ADD_PARTITION_SUBPART_ERROR)

Message: Trying to Add partition(s) with wrong number of subpartitions

- Error: 1501 SQLSTATE: HY000 (ER_ADD_PARTITION_NO_NEW_PARTITION)

Message: At least one partition must be added

- Error: 1502 SQLSTATE: HY000 (ER_COALESCE_PARTITION_NO_PARTITION)

Message: At least one partition must be coalesced

- Error: 1503 SQLSTATE: HY000 (ER_REORG_PARTITION_NOT_EXIST)

Message: More partitions to reorganise than there are partitions

- Error: 1504 SQLSTATE: HY000 (ER_SAME_NAME_PARTITION)

Message: Duplicate partition name %s

- Error: 1505 SQLSTATE: HY000 (ER_NO_BINLOG_ERROR)

Message: It is not allowed to shut off binlog on this command

- Error: 1506 SQLSTATE: HY000 (ER_CONSECUTIVE_REORG_PARTITIONS)

Message: When reorganising a set of partitions they must be in consecutive order

- Error: 1507 SQLSTATE: HY000 (ER_REORG_OUTSIDE_RANGE)

Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range

- Error: 1508 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_FAILURE)

Message: Partition function not supported in this version for this handler

- Error: 1509 SQLSTATE: HY000 (ER_PART_STATE_ERROR)

Message: Partition state cannot be defined from CREATE/ALTER TABLE

- Error: 1510 SQLSTATE: HY000 (ER_LIMITED_PART_RANGE)

Message: The %s handler only supports 32 bit integers in VALUES

- Error: 1511 SQLSTATE: HY000 (ER_PLUGIN_IS_NOT_LOADED)

Message: Plugin '%s' is not loaded

- Error: 1512 SQLSTATE: HY000 (ER_WRONG_VALUE)

Message: Incorrect %s value: '%s'

- Error: 1513 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE)

Message: Table has no partition for value %s

- Error: 1514 SQLSTATE: HY000 (ER_FILEGROUP_OPTION_ONLY_ONCE)

Message: It is not allowed to specify %s more than once

- Error: 1515 SQLSTATE: HY000 (ER_CREATE_FILEGROUP_FAILED)
Message: Failed to create %s
- Error: 1516 SQLSTATE: HY000 (ER_DROP_FILEGROUP_FAILED)
Message: Failed to drop %s
- Error: 1517 SQLSTATE: HY000 (ER_TABLESPACE_AUTO_EXTEND_ERROR)
Message: The handler doesn't support autoextend of tablespaces
- Error: 1518 SQLSTATE: HY000 (ER_WRONG_SIZE_NUMBER)
Message: A size parameter was incorrectly specified, either number or on the form 10M
- Error: 1519 SQLSTATE: HY000 (ER_SIZE_OVERFLOW_ERROR)
Message: The size number was correct but we don't allow the digit part to be more than 2 billion
- Error: 1520 SQLSTATE: HY000 (ER_ALTER_FILEGROUP_FAILED)
Message: Failed to alter: %s
- Error: 1521 SQLSTATE: HY000 (ER_BINLOG_ROW_LOGGING_FAILED)
Message: Writing one row to the row-based binary log failed
- Error: 1522 SQLSTATE: HY000 (ER_BINLOG_ROW_WRONG_TABLE_DEF)
Message: Table definition on master and slave does not match
- Error: 1523 SQLSTATE: HY000 (ER_BINLOG_ROW_RBR_TO_SBR)
Message: Slave running with --log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events
- Error: 1524 SQLSTATE: HY000 (ER_EVENT_ALREADY_EXISTS)
Message: Event '%s' already exists
- Error: 1525 SQLSTATE: HY000 (ER_EVENT_STORE_FAILED)
Message: Failed to store event %s. Error code %d from storage engine.
- Error: 1526 SQLSTATE: HY000 (ER_EVENT_DOES_NOT_EXIST)
Message: Unknown event '%s'
- Error: 1527 SQLSTATE: HY000 (ER_EVENT_CANT ALTER)
Message: Failed to alter event '%s'
- Error: 1528 SQLSTATE: HY000 (ER_EVENT_DROP_FAILED)
Message: Failed to drop %s
- Error: 1529 SQLSTATE: HY000 (ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG)
Message: INTERVAL is either not positive or too big

- Error: 1530 SQLSTATE: HY000 (ER_EVENT_ENDS_BEFORE_STARTS)
Message: ENDS is either invalid or before STARTS
- Error: 1531 SQLSTATE: HY000 (ER_EVENT_EXEC_TIME_IN_THE_PAST)
Message: Activation (AT) time is in the past
- Error: 1532 SQLSTATE: HY000 (ER_EVENT_OPEN_TABLE_FAILED)
Message: Failed to open mysql.event
- Error: 1533 SQLSTATE: HY000 (ER_EVENT_NEITHER_M_EXPR_NOR_M_AT)
Message: No datetime expression provided
- Error: 1534 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_CORRUPTED)
Message: Column count of mysql.%s is wrong. Expected %d, found %d. Table probably corrupted
- Error: 1535 SQLSTATE: HY000 (ER_CANNOT_LOAD_FROM_TABLE)
Message: Cannot load from mysql.%s. Table probably corrupted. See error log.
- Error: 1536 SQLSTATE: HY000 (ER_EVENT_CANNOT_DELETE)
Message: Failed to delete the event from mysql.event
- Error: 1537 SQLSTATE: HY000 (ER_EVENT_COMPILE_ERROR)
Message: Error during compilation of event's body
- Error: 1538 SQLSTATE: HY000 (ER_EVENT_SAME_NAME)
Message: Same old and new event name
- Error: 1539 SQLSTATE: HY000 (ER_EVENT_DATA_TOO_LONG)
Message: Data for column '%s' too long
- Error: 1540 SQLSTATE: HY000 (ER_DROP_INDEX_FK)
Message: Cannot drop index '%s': needed in a foreign key constraint
- Error: 1541 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX)
Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead
- Error: 1542 SQLSTATE: HY000 (ER_CANT_WRITE_LOCK_LOG_TABLE)
Message: You can't write-lock a log table. Only read access is possible
- Error: 1543 SQLSTATE: HY000 (ER_CANT_READ_LOCK_LOG_TABLE)
Message: You can't use usual read lock with log tables. Try READ LOCAL instead
- Error: 1544 SQLSTATE: 23000 (ER_FOREIGN_DUPLICATE_KEY)
Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

- Error: 1545 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE)
Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use scripts/mysql_fix_privilege_tables
- Error: 1546 SQLSTATE: HY000 (ER_REMOVED_SPACES)
Message: Leading spaces are removed from name '%s'
- Error: 1547 SQLSTATE: HY000 (ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR)
Message: Cannot switch out of the row-based binary log format when the session has open temporary tables
- Error: 1548 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT)
Message: Cannot change the binary logging format inside a stored function or trigger
- Error: 1549 SQLSTATE: HY000 (ER_NDB_CANT_SWITCH_BINLOG_FORMAT)
Message: The NDB cluster engine does not support changing the binlog format on the fly yet
- Error: 1550 SQLSTATE: HY000 (ER_PARTITION_NO_TEMPORARY)
Message: Cannot create temporary table with partitions
- Error: 1551 SQLSTATE: HY000 (ER_PARTITION_CONST_DOMAIN_ERROR)
Message: Partition constant is out of partition function domain
- Error: 1552 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_IS_NOT_ALLOWED)
Message: This partition function is not allowed
- Error: 1553 SQLSTATE: HY000 (ER_DDL_LOG_ERROR)
Message: Error in DDL log
- Error: 1554 SQLSTATE: HY000 (ER_NULL_IN_VALUES_LESS_THAN)
Message: Not allowed to use NULL value in VALUES LESS THAN
- Error: 1555 SQLSTATE: HY000 (ER_WRONG_PARTITION_NAME)
Message: Incorrect partition name
- Error: 1556 SQLSTATE: 25001 (ER_CANT_CHANGE_TX_ISOLATION)
Message: Transaction isolation level can't be changed while a transaction is in progress
- Error: 1557 SQLSTATE: HY000 (ER_DUP_ENTRY_AUTOINCREMENT_CASE)
Message: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'
- Error: 1558 SQLSTATE: HY000 (ER_EVENT_MODIFY_QUEUE_ERROR)
Message: Internal scheduler error %d

- Error: 1559 SQLSTATE: HY000 (ER_EVENT_SET_VAR_ERROR)
Message: Error during starting/stopping of the scheduler. Error code %u
- Error: 1560 SQLSTATE: HY000 (ER_PARTITION_MERGE_ERROR)
Message: Engine cannot be used in partitioned tables
- Error: 1561 SQLSTATE: HY000 (ER_CANT_ACTIVATE_LOG)
Message: Cannot activate '%s' log
- Error: 1562 SQLSTATE: HY000 (ER_RBR_NOT_AVAILABLE)
Message: The server was not built with row-based replication
- Error: 1563 SQLSTATE: HY000 (ER_BASE64_DECODE_ERROR)
Message: Decoding of base64 string failed
- Error: 1564 SQLSTATE: HY000 (ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA)
Message: Triggers can not be created on system tables
- Error: 1565 SQLSTATE: HY000 (ER_EVENT_RECURSIVITY_FORBIDDEN)
Message: Recursivity of EVENT DDL statements is forbidden when body is present
- Error: 1566 SQLSTATE: HY000 (ER_EVENTS_DB_ERROR)
Message: Cannot proceed because the tables used by events were found damaged at server start
- Error: 1567 SQLSTATE: HY000 (ER_ONLY_INTEGERS_ALLOWED)
Message: Only integers allowed as number here
- Error: 1568 SQLSTATE: HY000 (ER_AUTOINC_READ_FAILED)
Message: Failed to read auto-increment value from storage engine
- Error: 1569 SQLSTATE: HY000 (ER_USERNAME)
Message: user name
- Error: 1570 SQLSTATE: HY000 (ER_HOSTNAME)
Message: host name
- Error: 1571 SQLSTATE: HY000 (ER_WRONG_STRING_LENGTH)
Message: String '%s' is too long for %s (should be no longer than %d)
- Error: 1572 SQLSTATE: HY000 (ER_UNSUPPORTED_LOG_ENGINE)
Message: This storage engine cannot be used for log tables"
- Error: 1573 SQLSTATE: HY000 (ER_BAD_LOG_STATEMENT)
Message: You cannot '%s' a log table if logging is enabled

- Error: [1574 SQLSTATE: HY000 \(ER_NON_INSERTABLE_TABLE\)](#)

Message: The target table %s of the %s is not insertable-into

B.2. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the [include/errormsg.h](#) MySQL source file.
- The Message values correspond to the error messages that are listed in the [libmysql/errmsg.c](#) file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [2000 \(CR_UNKNOWN_ERROR\)](#)

Message: Unknown MySQL error

- Error: [2001 \(CR_SOCKET_CREATE_ERROR\)](#)

Message: Can't create UNIX socket (%d)

- Error: [2002 \(CR_CONNECTION_ERROR\)](#)

Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: [2003 \(CR_CONN_HOST_ERROR\)](#)

Message: Can't connect to MySQL server on '%s' (%d)

- Error: [2004 \(CR_IPSOCK_ERROR\)](#)

Message: Can't create TCP/IP socket (%d)

- Error: [2005 \(CR_UNKNOWN_HOST\)](#)

Message: Unknown MySQL server host '%s' (%d)

- Error: [2006 \(CR_SERVER_GONE_ERROR\)](#)

Message: MySQL server has gone away

- Error: [2007 \(CR_VERSION_ERROR\)](#)

Message: Protocol mismatch; server version = %d, client version = %d

- Error: [2008 \(CR_OUT_OF_MEMORY\)](#)

Message: MySQL client ran out of memory

- Error: [2009 \(CR_WRONG_HOST_INFO\)](#)

Message: Wrong host info

- Error: 2010 (CR_LOCALHOST_CONNECTION)

Message: Localhost via UNIX socket

- Error: 2011 (CR_TCP_CONNECTION)

Message: %s via TCP/IP

- Error: 2012 (CR_SERVER_HANDSHAKE_ERR)

Message: Error in server handshake

- Error: 2013 (CR_SERVER_LOST)

Message: Lost connection to MySQL server during query

- Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)

Message: Commands out of sync; you can't run this command now

- Error: 2015 (CR_NAMEDPIPE_CONNECTION)

Message: Named pipe: %s

- Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)

Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

- Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)

Message: Can't open named pipe to host: %s pipe: %s (%lu)

- Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)

Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error: 2019 (CR_CANT_READ_CHARSET)

Message: Can't initialize character set %s (path: %s)

- Error: 2020 (CR_NET_PACKET_TOO_LARGE)

Message: Got packet bigger than 'max_allowed_packet' bytes

- Error: 2021 (CR_EMBEDDED_CONNECTION)

Message: Embedded server

- Error: 2022 (CR_PROBE_SLAVE_STATUS)

Message: Error on SHOW SLAVE STATUS:

- Error: 2023 (CR_PROBE_SLAVE_HOSTS)

Message: Error on SHOW SLAVE HOSTS:

- Error: 2024 (CR_PROBE_SLAVE_CONNECT)

Message: Error connecting to slave:

- Error: 2025 (CR_PROBE_MASTER_CONNECT)

Message: Error connecting to master:

- Error: 2026 (CR_SSL_CONNECTION_ERROR)

Message: SSL connection error

- Error: 2027 (CR_MALFORMED_PACKET)

Message: Malformed packet

- Error: 2028 (CR_WRONG_LICENSE)

Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 (CR_NULL_POINTER)

Message: Invalid use of null pointer

- Error: 2030 (CR_NO_PREPARE_STMT)

Message: Statement not prepared

- Error: 2031 (CR_PARAMS_NOT_BOUND)

Message: No data supplied for parameters in prepared statement

- Error: 2032 (CR_DATA_TRUNCATED)

Message: Data truncated

- Error: 2033 (CR_NO_PARAMETERS_EXISTS)

Message: No parameters exist in the statement

- Error: 2034 (CR_INVALID_PARAMETER_NO)

Message: Invalid parameter number

- Error: 2035 (CR_INVALID_BUFFER_USE)

Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)

Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR_SHARED_MEMORY_CONNECTION)

Message: Shared memory: %s

- Error: 2038 (CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR)

Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR)

- Message: Can't open shared memory; no answer event received from server (%lu)
- Error: 2040 (CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR)
Message: Can't open shared memory; server could not allocate file mapping (%lu)
- Error: 2041 (CR_SHARED_MEMORY_CONNECT_MAP_ERROR)
Message: Can't open shared memory; server could not get pointer to file mapping (%lu)
- Error: 2042 (CR_SHARED_MEMORY_FILE_MAP_ERROR)
Message: Can't open shared memory; client could not allocate file mapping (%lu)
- Error: 2043 (CR_SHARED_MEMORY_MAP_ERROR)
Message: Can't open shared memory; client could not get pointer to file mapping (%lu)
- Error: 2044 (CR_SHARED_MEMORY_EVENT_ERROR)
Message: Can't open shared memory; client could not create %s event (%lu)
- Error: 2045 (CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR)
Message: Can't open shared memory; no answer from server (%lu)
- Error: 2046 (CR_SHARED_MEMORY_CONNECT_SET_ERROR)
Message: Can't open shared memory; cannot send request event to server (%lu)
- Error: 2047 (CR_CONN_UNKNOW_PROTOCOL)
Message: Wrong or unknown protocol
- Error: 2048 (CR_INVALID_CONN_HANDLE)
Message: Invalid connection handle
- Error: 2049 (CR_SECURE_AUTH)
Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)
- Error: 2050 (CR_FETCH_CANCELED)
Message: Row retrieval was canceled by mysql_stmt_close() call
- Error: 2051 (CR_NO_DATA)
Message: Attempt to read column without prior row fetch
- Error: 2052 (CR_NO_STMT_METADATA)
Message: Prepared statement contains no metadata
- Error: 2053 (CR_NO_RESULT_SET)
Message: Attempt to read a row while there is no result set associated with the statement

- Error: 2054 (CR_NOT_IMPLEMENTED)
Message: This feature is not implemented yet

Appendix C. Credits

This appendix lists the developers, contributors, and supporters that have helped to make MySQL what it is today.

C.1. Developers at MySQL AB

These are the developers that are or have been employed by MySQL AB to work on the [MySQL](#) database software, roughly in the order they started to work with us. Following each developer is a small list of the tasks that the developer is responsible for, or the accomplishments they have made. All developers are involved in support.

- Michael (Monty) Widenius
 - Lead developer and main author of the MySQL server ([mysqld](#)).
 - New functions for the string library.
 - Most of the [mysys](#) library.
 - The [ISAM](#) and [MyISAM](#) libraries (B-tree index file handlers with index compression and different record formats).
 - The [HEAP](#) library. A memory table system with our superior full dynamic hashing. In use since 1981 and published around 1984.
 - The [replace](#) program (take a look at it, it's **COOL!**).
 - Connector/ODBC (MyODBC), the ODBC driver for Windows.
 - Fixing bugs in MIT-pthreads to get it to work for MySQL Server. And also Unireg, a curses-based application tool with many utilities.
 - Porting of [mSQL](#) tools like [msqlperl](#), [DBD/DBI](#), and [DB2mysql](#).
 - Most of [crash-me](#) and the foundation for the MySQL benchmarks.
- David Axmark
 - Initial main writer of the **Reference Manual**, including enhancements to [texi2html](#).
 - Automatic Web site updating from the manual.
 - Initial Autoconf, Automake, and Libtool support.
 - Licensing.
 - Parts of all the text files. (Nowadays only the [README](#) is left. The rest ended up in the manual.)
 - Lots of testing of new features.
 - Our in-house Free Software legal expert.
 - Mailing list maintainer (who never has the time to do it right...).
 - Our original portability code (now more than 10 years old). Nowadays only some parts of [mysys](#) are left.

- Someone for Monty to call in the middle of the night when he just got that new feature to work.
- Chief "Open Sourcerer" (MySQL community relations).
- Jani Tolonen
 - `mysqlimport`
 - A lot of extensions to the command-line clients.
 - `PROCEDURE ANALYSE()`
- Sinisa Milivojevic (now in support)
 - Compression (with `zlib`) in the client/server protocol.
 - Perfect hashing for the lexical analyzer phase.
 - Multi-row `INSERT`
 - `mysqldump -e` option
 - `LOAD DATA LOCAL INFILE`
 - `SQL_CALC_FOUND_ROWS SELECT` option
 - `--max-user-connections=...` option
 - `net_read` and `net_write_timeout`
 - `GRANT/REVOKE` and `SHOW GRANTS FOR`
 - New client/server protocol for 4.0
 - `UNION` in 4.0
 - Multiple-table `DELETE/UPDATE`
 - Subqueries in the `FROM` clause (4.1).
 - User resources management
 - Initial developer of the `MySQL++` C++ API and the `MySQLGUI` client.
- Tonu Samuel (past developer)
 - VIO interface (the foundation for the encrypted client/server protocol).
 - MySQL Filesystem (a way to use MySQL databases as files and directories).
 - The `CASE` expression.
 - The `MD5()` and `COALESCE()` functions.
 - `RAID` support for `MyISAM` tables.
- Sasha Pachev (past developer)
 - Initial implementation of replication (up to version 4.0).

- `SHOW CREATE TABLE`.
- `mysql-bench`
- Matt Wagner
 - MySQL test suite.
 - Webmaster (until 2002).
- Miguel Solorzano (now in support)
 - Win32 development and release builds.
 - Windows NT server code.
 - WinMySQLAdmin
- Timothy Smith (now in support)
 - Dynamic character sets support.
 - configure, RPMs and other parts of the build system.
 - Initial developer of `libmysqld`, the embedded server.
- Sergei Golubchik
 - Full-text search.
 - Added keys to the `MERGE` library.
 - Precision math.
- Jeremy Cole (past developer)
 - Proofreading and editing this fine manual.
 - `ALTER TABLE ... ORDER BY`
 - `UPDATE ... ORDER BY`
 - `DELETE ... ORDER BY`
- Indrek Siitan
 - Designing/programming of our Web interface.
 - Author of our newsletter management system.
- Jorge del Conde (now in support)
 - `MySQLCC (MySQL Control Center)`
 - Win32 development
 - Initial implementation of the Web site portals.
- Venu Anuganti (past developer)

- MyODBC 3.51
- New client/server protocol for 4.1 (for prepared statements).
- Arjen Lentz (also handled community, 2004-2006; now works in Support)
 - Maintainer of the MySQL Reference Manual (2001-2004).
 - Preparing the O'Reilly printed edition of the manual (2002).
- Alexander (Bar) Barkov, Alexey (Holyfoot) Botchkov, and Ramil Kalimullin
 - Spatial data (GIS) and R-Trees implementation for 4.1
 - Unicode and character sets for 4.1; documentation for same
- Oleksandr (Sanja) Byelkin
 - Query cache in 4.0
 - Implementation of subqueries (4.1).
 - Implementation of views (5.0).
- Aleksey (Walrus) Kishkin and Alexey (Ranger) Stroganov
 - Benchmarks design and analysis.
 - Maintenance of the MySQL test suite.
- Zak Greant (past employee)
 - Open Source advocate, MySQL community relations.
- Carsten Pedersen
 - The MySQL Certification program.
- Lenz Grimmer
 - Production (build and release) engineering.
- Peter Zaitsev
 - [SHA1\(\)](#), [AES_ENCRYPT\(\)](#) and [AES_DECRYPT\(\)](#) functions.
 - Debugging, cleaning up various features.
- Alexander (Salle) Keremidarski
 - Support.
 - Debugging.
- Per-Erik Martin
 - Lead developer for stored procedures (5.0).
- Jim Winstead

- Former lead Web developer.
- Improving server, fixing bugs.
- Mark Matthews
 - Connector/J driver (Java).
- Peter Gulutzan
 - SQL standards compliance.
 - Documentation of existing MySQL code/algorithms.
 - Character set documentation.
- Guilhem Bichot
 - Replication, from [MySQL](#) version 4.0.
 - Fixed handling of exponents for [DECIMAL](#).
 - Author of [mysql_tableinfo](#).
 - Backup (in 5.1).
- Antony T. Curtis
 - Porting of the MySQL Database software to OS/2.
- Mikael Ronstrom
 - Much of the initial work on NDB Cluster until 2000. Roughly half the code base at that time. Transaction protocol, node recovery, system restart and restart code and parts of the API functionality.
 - Lead Architect, developer, debugger of NDB Cluster 1994-2004
 - Lots of optimizations
- Jonas Oreland
 - On-line Backup
 - The automatic test environment of MySQL Cluster
 - Portability Library for NDB Cluster
 - Lots of other things
- Pekka Nouisiainen
 - Ordered index implementation of MySQL Cluster
 - BLOB support in MySQL Cluster
 - Charset support in MySQL Cluster
- Martin Skold

- Unique index implementation of MySQL Cluster
- Integration of NDB Cluster into MySQL
- Magnus Svensson
 - The test framework for MySQL Cluster
 - Integration of NDB Cluster into MySQL
- Tomas Ulin
 - Lots of work on configuration changes for simple installation and use of MySQL Cluster
- Konstantin Osipov
 - Prepared statements.
 - Cursors.
- Dmitri Lenev
 - Time zone support.
 - Triggers (in 5.0).

C.2. Contributors to MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize those who have made contributions of one kind or another to the [MySQL distribution](#). Contributors are listed here, in somewhat random order:

- Gianmassimo Vigazzola <qwertg@mbx.vol.it> or <qwertg@tin.it>

The initial port to Win32/NT.

- Per Eric Olsson

For more or less constructive criticism and real testing of the dynamic record format.

- Irena Pancirov <irena@mail.yacc.it>

Win32 port with Borland compiler. [mysqlshutdown.exe](#) and [mysqlwatch.exe](#)

- David J. Hughes

For the effort to make a shareware SQL database. At TcX, the predecessor of MySQL AB, we started with [mSQL](#), but found that it couldn't satisfy our purposes so instead we wrote an SQL interface to our application builder Unireg. [mysqladmin](#) and [mysql](#) client are programs that were largely influenced by their [mSQL](#) counterparts. We have put a lot of effort into making the MySQL syntax a superset of [mSQL](#). Many of the API's ideas are borrowed from [mSQL](#) to make it easy to port free [mSQL](#) programs to the MySQL API. The MySQL software doesn't contain any code from [mSQL](#). Two files in the distribution ([client/insert_test.c](#) and [client/select_test.c](#)) are based on the corresponding (non-copyrighted) files in the [mSQL](#) distribution, but are modified as examples showing the changes necessary to convert code from [mSQL](#) to MySQL Server. ([mSQL](#) is copyrighted David J. Hughes.)

- Patrick Lynch
For helping us acquire <http://www.mysql.com/>.
- Fred Lindberg
For setting up qmail to handle the MySQL mailing list and for the incredible help we got in managing the MySQL mailing lists.
- Igor Romanenko <igor@frog.kiev.ua>
[mysqldump](#) (previously [msqldump](#), but ported and enhanced by Monty).
- Yuri Dario
For keeping up and extending the MySQL OS/2 port.
- Tim Bunce
Author of [mysqlhotcopy](#).
- Zarko Mocnik <zarko.mocnik@dem.si>
Sorting for Slovenian language.
- "TAMITO" <tommy@valley.ne.jp>
The [_MB](#) character set macros and the [ujis](#) and [sjis](#) character sets.
- Joshua Chamas <joshua@chamas.com>
Base for concurrent insert, extended date syntax, debugging on NT, and answering on the MySQL mailing list.
- Yves Carlier <Yves.Carlier@rug.ac.be>
[mysqlaccess](#), a program to show the access rights for a user.
- Rhys Jones <rhys@wales.com> (And GWE Technologies Limited)
For one of the early JDBC drivers.
- Dr Xiaokun Kelvin ZHU <X.Zhu@brad.ac.uk>
Further development of one of the early JDBC drivers and other MySQL-related Java tools.
- James Cooper <pixel@organic.com>
For setting up a searchable mailing list archive at his site.
- Rick Mehalick <Rick_Mehalick@i-o.com>
For [xmysql](#), a graphical X client for MySQL Server.
- Doug Sisk <sisk@wix.com>
For providing RPM packages of MySQL for Red Hat Linux.
- Diemand Alexander V. <axeld@vial.ethz.ch>

For providing RPM packages of MySQL for Red Hat Linux-Alpha.

- Antoni Pamies Olive <toni@readysoft.es>

For providing RPM versions of a lot of MySQL clients for Intel and SPARC.

- Jay Bloodworth <jay@pathways.sde.state.sc.us>

For providing RPM versions for MySQL 3.21.

- David Sacerdote <davids@secnet.com>

Ideas for secure checking of DNS hostnames.

- Wei-Jou Chen <jou@nematic.ieo.nctu.edu.tw>

Some support for Chinese(BIG5) characters.

- Wei He <hewei@mail.ied.ac.cn>

A lot of functionality for the Chinese(GBK) character set.

- Jan Pazdziora <adelton@fi.muni.cz>

Czech sorting order.

- Zeev Suraski <bourbon@netvision.net.il>

`FROM_UNIXTIME()` time formatting, `ENCRYPT()` functions, and `bison` advisor. Active mailing list member.

- Luuk de Boer <luuk@wxs.nl>

Ported (and extended) the benchmark suite to `DBI/DBD`. Have been of great help with `crash-me` and running benchmarks. Some new date functions. The `mysql_setpermission` script.

- Alexis Mikhailov <root@medinf.chuvashia.su>

User-defined functions (UDFs); `CREATE FUNCTION` and `DROP FUNCTION`.

- Andreas F. Bobak <bobak@relog.ch>

The `AGGREGATE` extension to user-defined functions.

- Ross Wakelin <R.Wakelin@march.co.uk>

Help to set up InstallShield for MySQL-Win32.

- Jethro Wright III <jetman@li.net>

The `libmysql.dll` library.

- James Pereria <jpereira@iafrica.com>

MySQLmanager, a Win32 GUI tool for administering MySQL Servers.

- Curt Sampson <cjs@portal.ca>

Porting of MIT-pthreads to NetBSD/Alpha and NetBSD 1.3/i386.

- Martin Ramsch <m.ramsch@computer.org>
Examples in the MySQL Tutorial.
- Steve Harvey
For making `mysqlaccess` more secure.
- Konark IA-64 Centre of Persistent Systems Private Limited
<http://www.pspl.co.in/konark/>. Help with the Win64 port of the MySQL server.
- Albert Chin-A-Young.
Configure updates for Tru64, large file support and better TCP wrappers support.
- John Birrell
Emulation of `pthread_mutex()` for OS/2.
- Benjamin Pflugmann
Extended `MERGE` tables to handle `INSERTS`. Active member on the MySQL mailing lists.
- Jocelyn Fournier
Excellent spotting and reporting innumerable bugs (especially in the MySQL 4.1 subquery code).
- Marc Liyanage
Maintaining the Mac OS X packages and providing invaluable feedback on how to create Mac OS X PKGs.
- Robert Rutherford
Providing invaluable information and feedback about the QNX port.
- Previous developers of NDB Cluster
Lots of people were involved in various ways summer students, master thesis students, employees. In total more than 100 people so too many to mention here. Notable name is Ataullah Dabaghi who up until 1999 contributed around a third of the code base. A special thanks also to developers of the AXE system which provided much of the architectural foundations for NDB Cluster with blocks, signals and crash tracing functionality. Also credit should be given to those who believed in the ideas enough to allocate of their budgets for its development from 1992 to present time.

Other contributors, bugfinders, and testers: James H. Thompson, Maurizio Menghini, Wojciech Tryc, Luca Berra, Zarko Mocnik, Wim Bonis, Elmar Haneke, <jehamby@lightside>, <psmith@BayNetworks.com>, <duane@connect.com.au>, Ted Deppner <ted@psyber.com>, Mike Simons, Jaakko Hyvatti.

And lots of bug report/patches from the folks on the mailing list.

A big tribute goes to those that help us answer questions on the MySQL mailing lists:

- Daniel Koch <dkoch@amcity.com>
Irix setup.

- Luuk de Boer <luuk@wxs.nl>
Benchmark questions.
- Tim Sailer <tps@users.buoy.com>
DBD: :mysql questions.
- Boyd Lynn Gerber <gerberb@zenez.com>
SCO-related questions.
- Richard Mehalick <RM186061@shellus.com>
xmysql-related questions and basic installation questions.
- Zeev Suraski <bourbon@netvision.net.il>
Apache module configuration questions (log & auth), PHP-related questions, SQL syntax-related questions and other general questions.
- Francesc Guasch <frankie@citel.upc.es>
General questions.
- Jonathan J Smith <jsmith@wtp.net>
Questions pertaining to OS-specifics with Linux, SQL syntax, and other things that might need some work.
- David Sklar <sklar@student.net>
Using MySQL from PHP and Perl.
- Alistair MacDonald <A.MacDonald@uel.ac.uk>
Is flexible and can handle Linux and perhaps HP-UX. Tries to get users to use [mysqlbug](#).
- John Lyon <jlyon@imag.net>
Questions about installing MySQL on Linux systems, using either [.rpm](#) files or compiling from source.
- Lorvid Ltd. <lorvid@WOLFENET.com>
Simple billing/license/support/copyright issues.
- Patrick Sherrill <patrick@coconet.com>
ODBC and VisualC++ interface questions.
- Randy Harmon <rjharmon@uptimecomputers.com>
DBD, Linux, some SQL syntax questions.

C.3. Documenters and translators

The following people have helped us with writing the MySQL documentation and translating the docu-

mentation or error messages in MySQL.

- Paul DuBois
Ongoing help with making this manual correct and understandable. That includes rewriting Monty's and David's attempts at English into English as other people know it.
- Kim Aldale
Helped to rewrite Monty's and David's early attempts at English into English.
- Michael J. Miller Jr. <mke@terrapin.turbolift.com>
For the first MySQL manual. And a lot of spelling/language fixes for the FAQ (that turned into the MySQL manual a long time ago).
- Yan Cailin
First translator of the MySQL Reference Manual into simplified Chinese in early 2000 on which the Big5 and HK coded (<http://mysql.hitstar.com/>) versions were based. [Personal home page at linuxdb.yeah.net](http://linuxdb.yeah.net) [<http://linuxdb.yeah.net>].
- Jay Flaherty <fty@mediapulse.com>
Big parts of the Perl `DBI/DBD` section in the manual.
- Paul Southworth <pauls@etext.org>, Ray Loyzaga <yar@cs.su.oz.au>
Proof-reading of the Reference Manual.
- Therrien Gilbert <gilbert@ican.net>, Jean-Marc Pouyot <jmp@scalaire.fr>
French error messages.
- Petr Snajdr, <snajdr@pvt.net>
Czech error messages.
- Jaroslaw Lewandowski <jotel@itnet.com.pl>
Polish error messages.
- Miguel Angel Fernandez Roiz
Spanish error messages.
- Roy-Magne Mo <rmo@www.hivolda.no>
Norwegian error messages and testing of MySQL 3.21.xx.
- Timur I. Bakeyev <root@timur.tatarstan.ru>
Russian error messages.
- <brenno@dewinter.com> & Filippo Grassilli <phil@hyppo.com>
Italian error messages.
- Dirk Munzinger <dirk@trinity.saar.de>

German error messages.

- Billik Stefan <billik@sun.uniag.sk>

Slovak error messages.

- Stefan Saroiu <tzoompy@cs.washington.edu>

Romanian error messages.

- Peter Feher

Hungarian error messages.

- Roberto M. Serqueira

Portuguese error messages.

- Carsten H. Pedersen

Danish error messages.

- Arjen Lentz

Dutch error messages, completing earlier partial translation (also work on consistency and spelling).

C.4. Libraries used by and included with MySQL

The following is a list of the creators of the libraries we have included with the MySQL server source to make it easy to compile and install MySQL. We are very thankful to all individuals that have created these and it has made our life much easier.

- Fred Fish

For his excellent C debugging and trace library. Monty has made a number of smaller improvements to the library (speed and additional options).

- Richard A. O'Keefe

For his public domain string library.

- Henry Spencer

For his regex library, used in `WHERE column REGEXP regexp`.

- Chris Provenzano

Portable user level pthreads. From the copyright: This product includes software developed by Chris Provenzano, the University of California, Berkeley, and contributors. We are currently using version 1_60_beta6 patched by Monty (see [mit-pthreads/Changes-mysql](#)).

- Jean-loup Gailly and Mark Adler

For the zlib library (used on MySQL on Windows).

- Bjorn Benson

For his `safe_malloc` (memory checker) package which is used in when you configure MySQL with `-debug`.

- Free Software Foundation

The `readline` library (used by the `mysql` command-line client).

- The NetBSD foundation

The `libedit` package (optionally used by the `mysql` command-line client).

C.5. Packages that support MySQL

The following is a list of creators/maintainers of some of the most important API/packages/applications that a lot of people use with MySQL.

We can't list every possible package here because the list would then be way to hard to maintain. For other packages, please refer to the software portal at <http://solutions.mysql.com/software/>.

- Tim Bunce, Alligator Descartes

For the `DBD` (Perl) interface.

- Andreas Koenig <a.koenig@mind.de>

For the Perl interface for MySQL Server.

- Jochen Wiedmann <wiedmann@neckar-alb.de>

For maintaining the Perl `DBD::mysql` module.

- Eugene Chan <eugene@acenet.com.sg>

For porting PHP for MySQL Server.

- Georg Richter

MySQL 4.1 testing and bug hunting. New PHP 5.0 `mysqli` extension (API) for use with MySQL 4.1 and up.

- Giovanni Maruzzelli <maruzz@matrice.it>

For porting iODBC (Unix ODBC).

- Xavier Leroy <Xavier.Leroy@inria.fr>

The author of LinuxThreads (used by the MySQL Server on Linux).

C.6. Tools that were used to create MySQL

The following is a list of some of the tools we have used to create MySQL. We use this to express our thanks to those that has created them as without these we could not have made MySQL what it is today.

- Free Software Foundation

From whom we got an excellent compiler ([gcc](#)), an excellent debugger ([gdb](#) and the [libc](#) library (from which we have borrowed [strto.c](#) to get some code working in Linux).

- Free Software Foundation & The XEmacs development team

For a really great editor/environment used by almost everybody at MySQL AB.

- Julian Seward

Author of [valgrind](#), an excellent memory checker tool that has helped us find a lot of otherwise hard to find bugs in MySQL.

- Dorothea Lütkehaus and Andreas Zeller

For [DDD](#) (The Data Display Debugger) which is an excellent graphical front end to [gdb](#)).

C.7. Supporters of MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize the following companies, which helped us finance the development of the [MySQL server](#), such as by paying us for developing a new feature or giving us hardware for development of the [MySQL server](#).

- VA Linux / Andover.net

Funded replication.

- NuSphere

Editing of the MySQL manual.

- Stork Design studio

The MySQL Web site in use between 1998-2000.

- Intel

Contributed to development on Windows and Linux platforms.

- Compaq

Contributed to Development on Linux/Alpha.

- SWSOft

Development on the embedded [mysqld](#) version.

- FutureQuest

[--skip-show-database](#)

Appendix D. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.1, which is currently MySQL 5.1.12-beta. Starting with MySQL 5.0, we began offering a new version of the Manual for each new series of MySQL releases (5.0, 5.1, and so on). For information about changes in previous release series of the MySQL database software, see the corresponding version of this Manual. For information about legacy versions of the MySQL software through the 4.1 series, see *MySQL 3.23, 4.0, 4.1 Reference Manual*.

We update this section as we add new features in the 5.1 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last BitKeeper ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

D.1. Changes in release 5.1.x (Development)

An overview of which features were added in MySQL 5.1 can be found here: [Section 1.6.1, “What's New in MySQL 5.1”](#).

For a full list of changes, please refer to the changelog sections for each individual 5.1.x release.

D.1.1. Changes in release 5.1.12 (Not yet released)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Functionality added or changed:

- **Incompatible change:** Support for the BerkeleyDB (BDB) engine has been dropped from this release. Any existing tables that are in BDB format will not be readable from within MySQL from 5.1.12 or newer. You should convert your tables to another storage engine *before* upgrading to 5.1.12.
- **Incompatible change:** The namespace for scheduled events has changed, such that events are no longer unique to individual users. This also means that a user with the `EVENT` privilege on a given database can now view, alter, or drop any events defined on that database.

If you used scheduled events in an earlier MySQL 5.1 release, you should rename any of them having the same name and defined on the same database but belonging to different users — so that all events in a given database have unique names — *before* upgrading to 5.1.12 (or newer).

For additional information, see [Section 20.5, “The Event Scheduler and MySQL Privileges”](#).

- **Incompatible change:** The permitted values for and behaviour of the `event_scheduler` system variable have changed. Permitted values are now `ON`, `OFF`, and `DISABLED`, with `OFF` being the default. It is not possible to change its value to or from `DISABLED` while the server is running.

For details, see [Section 20.1, “Event Scheduler Overview”](#).

- **Incompatible change:** The full-text parser plugin interface has changed in two ways:
 - The `MYSQL_FTPARSER_PARAM` structure has a new `flags` member. This is zero if there are no special flags, or `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- The `mysql_parse()` and `mysql_add_word()` functions now take a `MYSQL_FTPARSER_PARAM` as their first argument, not a `MYSQL_FTPARSER_PARAM::mysql_ftparam` as before.

These changes are not backward compatible, so the API version (`MYSQL_FTPARSER_INTERFACE_VERSION`) has changed. For additional information, see [Section 26.2.5, “Writing Plugins”](#).

- **Incompatible change:** In the `INFORMATION_SCHEMA.EVENTS` table, the `EVENT_DEFINITION` column now contains the SQL executed by a scheduled event.

The `EVENT_BODY` column now contains the language used for the statement or statements shown in `EVENT_DEFINITION`. In MySQL 5.1, the value shown in `EVENT_BODY` is always `SQL`.

These changes were made to bring this table into line with the `INFORMATION_SCHEMA.ROUTINES` table, and that table's `ROUTINE_BODY` and `ROUTINE_DEFINITION` columns. ([Bug#16992](#) [<http://bugs.mysql.com/16992>])

- **Incompatible change:** MySQL Cluster node and system restarts formerly required that all fragments use the same local checkpoint (LCP); beginning with this version, it is now possible for different fragments to use different LCPs during restarts. This means that data node filesystems must be rebuilt as part of any upgrade to this version by restarting all data nodes with the `--initial` option. ([Bug#21271](#) [<http://bugs.mysql.com/21271>], [Bug#21478](#) [<http://bugs.mysql.com/21478>])

See [Section 15.5.2, “Cluster Upgrade and Downgrade Compatibility”](#), and related sections of the Manual before upgrading a MySQL Cluster to version 5.1.12 or later.

- The general query log and slow query log now can be enabled or disabled at runtime, and the name of each log file can be changed at runtime. See [Section 5.12.3, “The General Query Log”](#), and [Section 5.12.5, “The Slow Query Log”](#).
- The output generated by the server when using the `--xml` option has changed with regard to null values. It now matches the output from `mysqldump --xml`. That is, a column containing a `NULL` value is now reported as

```
<field name="column_name" xsi:nil="true" />
```

whereas a column containing the string value `'NULL'` is reported as

```
<field name="column_name">NULL</field>
```

and a column containing an empty string is reported as

```
<field name="column_name">>/field>
```

([Bug#21263](http://bugs.mysql.com/21263) [<http://bugs.mysql.com/21263>])

- The general query log and slow query logs now can be enabled or disabled at runtime with the `general_log` and `slow_query_log` system variables, and the name of the log files can be changed by setting the `general_log_file` and `slow_query_log_file` system variables. See [Section 5.12.3, “The General Query Log”](#), and [Section 5.12.5, “The Slow Query Log”](#).
- The following statements now can be executed as prepared statements (using `PREPARE` plus `EXECUTE`):

```
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
      | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN
```

([Bug#20665](http://bugs.mysql.com/20665) [<http://bugs.mysql.com/20665>])

- The Instance Manager `--passwd` option has been renamed to `--print-password-line`. Other options were added to enable management of the IM password file from the command line: `--add-user`, `--drop-user`, `--edit-user`, `--list-users`, `--check-password-file`, `--clean-password-file`, `--username`, and `--password`. The `--mysql-safe-compatible` option was added to cause the Instance Manager to act similarly to `mysqld_safe`.
- On Windows, typing Control-C caused the `mysql` client to crash. Now it causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. ([Bug#17926](http://bugs.mysql.com/17926) [<http://bugs.mysql.com/17926>]; see also [Bug#1989](http://bugs.mysql.com/1989) [<http://bugs.mysql.com/1989>])
- `TEXT` and `BLOB` columns do not support `DEFAULT` values. However, when a default of `' '` was specified, the specification was silently ignored. This now results in a warning, or an error in strict mode. ([Bug#19498](http://bugs.mysql.com/19498) [<http://bugs.mysql.com/19498>])
- The `mysql` client now allows `\l` in the `prompt` command argument to insert the current delimiter into the prompt. ([Bug#14448](http://bugs.mysql.com/14448) [<http://bugs.mysql.com/14448>])
- Log table changes: By default, the log tables use the `CSV` storage engine, as before. But now the log tables can be altered to use the `MyISAM` storage engine. You cannot use `ALTER TABLE` to alter a log table that is in use. The log must be disabled first. No engines other than `CSV` or `MyISAM` are legal for the log tables. The use of `DROP TABLE` for log tables is similarly restricted: It cannot be used to drop a log table that is in use. The log must be disabled first. (These changes also correct a

deadlock that occurred for an attempt to drop an in-use log table.) (Bug#18559 [http://bugs.mysql.com/18559])

- The `LEFT()` and `RIGHT()` functions return `NULL` if any argument is `NULL`. (Bug#11728 [http://bugs.mysql.com/11728])
- `EXPLAIN EXTENDED` now shows a `filtered` column that is an estimated percentage of the examined rows that will be joined with the previous tables. (Bug#14940 [http://bugs.mysql.com/14940])
- For `mysqlshow`, if a database name argument contains wildcard characters (such as `'_'`) but matches a single database name exactly, treat the name as a literal name. This allows a command such as `mysqlshow information_schema` work without having to escape the wildcard character. (Bug#19147 [http://bugs.mysql.com/19147])
- If a `DROP VIEW` statement named multiple views, it stopped with an error if a non-existent view was named and did not drop the remaining views. Now it continues on and reports an error at the end, similar to `DROP TABLE`. (Bug#16614 [http://bugs.mysql.com/16614])
- `SHOW CREATE TABLE` now shows constraints for `InnoDB` tables. (Bug#16614 [http://bugs.mysql.com/16614])
- Added the `--set-charset` option to `mysqlbinlog` to allow the character set to be specified for processing binary log files. (Bug#18351 [http://bugs.mysql.com/18351])
- Added the `--ndb-use-copying-alter-table` option to `mysqld` to provide a fallback in case of problems with online `ALTER TABLE` operations on `NDBCluster` tables.
- Added the `SHOW CONTRIBUTORS` statement.
- It is no longer possible to create partitioned tables using the `CSV` storage engine.
- `NDB Cluster`: Some queries involving joins on very large `NDB` tables could crash the MySQL server. (Bug#21059 [http://bugs.mysql.com/21059])
- `NDB Cluster`: The status variables `Ndb_connected_host` and `Ndb_connected_port` were renamed to `Ndb_config_from_host` and `Ndb_config_from_port`, respectively.
- `NDB Cluster`: A number of erroneous, misleading, or missing error messages have been corrected. (Bug#17297 [http://bugs.mysql.com/17297] & Bug#19543 [http://bugs.mysql.com/19543])
- `NDB Cluster`: It is no longer possible to create Cluster tables using any partitioning type other than `[LINEAR] KEY`. Attempting to do so now raises an error.
- The `ExtractValue()` function now produces an error when passed an XML fragment that is not well-formed. (Bug#18201 [http://bugs.mysql.com/18201])

(Previously, the function allowed invalid XML fragments to be used.)

- There were several issues regarding how `SHOW STATUS` affected some status variables and logging which could impact monitoring the MySQL Server. The behavior of this statement has been modified in two ways:
 - `SHOW STATUS` is no longer logged to the slow query log.
 - `SHOW STATUS` no longer updates any session status variables, except for `com_show_status`.

However, `SHOW STATUS` continues to update *global* status variables to allow monitoring of what

the server is actually doing. This is because `SHOW STATUS` creates temporary tables that may affect performance if it is called excessively often. (Bug#10210 [http://bugs.mysql.com/10210], Bug#19764 [http://bugs.mysql.com/19764])

- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug#20216 [http://bugs.mysql.com/20216])
- The bundled yaSSL library was upgraded to version 1.3.7.
- The bundled yaSSL library licensing has added a FLOSS exception similar to MySQL to resolve licensing incompatibilities with MySQL. (See the `extra/yaSSL/FLOSS-EXCEPTIONS` file in a MySQL source distribution for details.) (Bug#16755 [http://bugs.mysql.com/16755])
- `mysqlslap` threads now try to connect up to 10 times if the initial connect attempt fails. (Bug#21297 [http://bugs.mysql.com/21297])
- For a successful dump, `mysqldump` now writes a SQL comment to the end of the dump file in the following format:

```
-- Dump completed on YYYY-MM-DD hh:mm:ss
```

(Bug#10877 [http://bugs.mysql.com/10877])

- The `mysqld` and `mysqlmanager` manpages have been reclassified from volume 1 to volume 8. (Bug#21220 [http://bugs.mysql.com/21220])
- In the `INFORMATION_SCHEMA.ROUTINES` table the `ROUTINE_DEFINITION` column now is defined as `NULL` rather than `NOT NULL`. Also, `NULL` rather than the empty string is returned as the column value if the user does not have sufficient privileges to see the routine definition. (Bug#20230 [http://bugs.mysql.com/20230])
- `configure` now defines the symbol `DEBUG_ON` in `config.h` to indicate whether the source tree is configured to be compiled with debugging support. (Bug#19517 [http://bugs.mysql.com/19517])
- The MySQL distribution now compiles on UnixWare 7.13. (Bug#20190 [http://bugs.mysql.com/20190])
- The `mysql` client used the default character set if it automatically reconnected to the server, which is incorrect if the character set had been changed. To enable the character set to remain synchronized on the client and server, the `mysql` command `charset` (or `\C`) that changes the default character set and now also issues a `SET NAMES` statement. The changed character set is used for reconnects. (Bug#11972 [http://bugs.mysql.com/11972])
- The `STATE` column of the `INFORMATION_SCHEMA.PROCESSLIST` table was increased from 30 to 64 characters to accommodate longer state values. (Bug#21652 [http://bugs.mysql.com/21652])
- `TIMESTAMP` columns that are `NOT NULL` now are reported that way by `SHOW COLUMNS` and `INFORMATION_SCHEMA`. (Bug#20910 [http://bugs.mysql.com/20910])
- `INFORMATION_SCHEMA` contains new tables, `GLOBAL_STATUS`, `SESSION_STATUS`, `GLOBAL_VARIABLES`, and `SESSION_VARIABLES`, that correspond to the output from the `SHOW {GLOBAL|SESSION} STATUS` and `SHOW {GLOBAL|SESSION} VARIABLES` statements.
- The `BINARY` keyword now is forbidden as a data type attribute in stored routines (for example, `DECLARE v1 VARCHAR(25) BINARY`), because `DECLARE` does not support collations, and in this context `BINARY` specifies the binary collation of the variable's character set. (Bug#20701

[<http://bugs.mysql.com/20701>])

- The source distribution has been updated so that the UDF example can be compiled under Windows with CMake. See [Section 26.3.4.5, “Compiling and Installing User-Defined Functions”](#). (Bug#19121 [<http://bugs.mysql.com/19121>])
- `LOAD DATA INFILE` no longer causes an implicit commit for all storage engines. It now causes an implicit commit only for tables using the `NDB` storage engine. (Bug#11151 [<http://bugs.mysql.com/11151>])
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See [Section 13.6.2.2, “LOAD DATA FROM MASTER Syntax”](#), for recommended alternatives. (Bug#18822 [<http://bugs.mysql.com/18822>])
- `mysqldump` now has a `--flush-privileges` option. It causes `mysqldump` to emit a `FLUSH PRIVILEGES` statement after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. (Bug#21424 [<http://bugs.mysql.com/21424>])
- The default value of the `tmp_table_size` system variable was lowered from 32MB to 16MB because it is bounded by the value of `max_heap_table_size`, which has a default of 16MB. (Bug#18875 [<http://bugs.mysql.com/18875>])
- The number of `InnoDB` threads is no longer limited to 1,000 on Windows. (Bug#22268 [<http://bugs.mysql.com/22268>])
- Memory consumption of the `InnoDB` data dictionary cache was roughly halved by cleaning up the data structures. (Bug#20877 [<http://bugs.mysql.com/20877>])

Bugs fixed:

- **Security fix:** On Linux, and possibly other platforms using case-sensitive filesystems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. (CVE-2006-4226 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-4226>], Bug#17647 [<http://bugs.mysql.com/17647>])
- **Security fix:** If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. (Bug#15195 [<http://bugs.mysql.com/15195>])
- **Security fix:** A stored routine created by one user and then made accessible to a different user using `GRANT EXECUTE` could be executed by that user with the privileges of the routine's definer. (CVE-2006-4227 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-4227>], Bug#18630 [<http://bugs.mysql.com/18630>])
- **Incompatible change:** For `utf8` columns, the full-text parser incorrectly considered several non-word punctuation and whitespace characters as word characters, causing some searches to return incorrect results. (Bug#19580 [<http://bugs.mysql.com/19580>])

The fix involves a change to the full-text parser, so any tables that have `FULLTEXT` indexes on `utf8` columns must be repaired with `REPAIR TABLE`:

```
REPAIR TABLE tbl_name QUICK;
```

- When using row based replication, a `CREATE TABLE . . . SELECT` statement would be replicated, even if the table creation failed on the master (for example, due to a duplicate key failure). (Bug#20265 [<http://bugs.mysql.com/20265>])
- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a duplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. (Bug#22384 [<http://bugs.mysql.com/22384>])
- The optimizer did not take advantage of indexes on columns used for the second or third arguments of `BETWEEN`. (Bug#18165 [<http://bugs.mysql.com/18165>])
- Subqueries with aggregate functions but no `FROM` clause could return incorrect results. (Bug#21540 [<http://bugs.mysql.com/21540>])
- The `CSV` storage engine failed to detect some table corruption. (Bug#22080 [<http://bugs.mysql.com/22080>])
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug#21381 [<http://bugs.mysql.com/21381>])
- Successive invocations of a `COUNT(*)` query containing a join on two `MyISAM` tables and a `WHERE` clause of the form `WHERE (table1.column1 = table2.column2) OR table2.column2 IS NULL` yielded different results. (Bug#21019 [<http://bugs.mysql.com/21019>])
- It was possible to provide the `ExtractValue()` function with input containing “tags” that were not valid XML; for example, it was possible to use tag names beginning with a digit, which are disallowed by the W3C's XML 1.0 specification. Such cases caused the function to return “junk” output rather than an error message signalling the user as to the true nature of the problem. (Bug#20854 [<http://bugs.mysql.com/20854>])
- The presence of a subquery in the `ON` clause of a join in a view definition prevented the `MERGE` algorithm from being used for the view in cases where it should be allowed. (Bug#21646 [<http://bugs.mysql.com/21646>])
- `BIT` columns were not replicated properly under row-based replication. (Bug#22550 [<http://bugs.mysql.com/22550>])
- Conversion of values inserted into a `BIT` column could affect adjacent columns. (Bug#22271 [<http://bugs.mysql.com/22271>])
- The URL into the online manual that is printed in the stack trace message by the server was out of date. (Bug#21449 [<http://bugs.mysql.com/21449>])
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug#21081 [<http://bugs.mysql.com/21081>])
- `PROCEDURE ANALYSE()` returned incorrect values of `M FLOAT(M, D)` and `DOUBLE(M, D)`. (Bug#20305 [<http://bugs.mysql.com/20305>])
- Join conditions using partial indexes on `utf8` columns of `InnoDB` tables incorrectly ignored rows where the length of the actual value was greater than the length of the partial index. (Bug#19960 [<http://bugs.mysql.com/19960>])
- On an `INSERT` into an updatable but non-insertable view, an error message was issued stating that the view was not updatable. Now the message says the view is not insertable-into. (Bug#5505

[<http://bugs.mysql.com/5505>])

- `INSERT DELAYED` did not honor `SET INSERT_ID` or the `auto_increment_*` system variables. (Bug#20627 [<http://bugs.mysql.com/20627>], Bug# 20830)
- For character sets having a `mbmaxlen` value of 2, any `ALTER TABLE` statement changed `TEXT` columns to `MEDIUMTEXT`. (Bug#21620 [<http://bugs.mysql.com/21620>])
- A query that used `GROUP BY` and an `ALL` or `ANY` quantified subquery in a `HAVING` clause could trigger an assertion failure. (Bug#21853 [<http://bugs.mysql.com/21853>])
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default value to be lost. (Bug#20108 [<http://bugs.mysql.com/20108>])
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. (Bug#20670 [<http://bugs.mysql.com/20670>])
- A loaded storage engine plugin did not load after a server restart. (Bug#21610 [<http://bugs.mysql.com/21610>])
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. (Bug#21096 [<http://bugs.mysql.com/21096>])
- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. (Bug#21414 [<http://bugs.mysql.com/21414>])
- `mysql_com.h` unnecessarily referred to the `ulong` type. (Bug#22227 [<http://bugs.mysql.com/22227>])
- Incorporated some portability fixes into the definition of `__attribute__` in `my_global.h`. (Bug#2717 [<http://bugs.mysql.com/2717>])
- Linking the `pthread` library to single-threaded MySQL libraries caused `dlopen()` to fail at runtime on HP-UX. (Bug#18267 [<http://bugs.mysql.com/18267>])
- Loading a plugin caused any an existing plugin with the same name to be lost. (Bug#20615 [<http://bugs.mysql.com/20615>])
- In the package of pre-built time zone tables that is available for download at <http://dev.mysql.com/downloads/timezones.html>, the tables now explicitly use the `utf8` character set so that they work the same way regardless of the system character set value. (Bug#21208 [<http://bugs.mysql.com/21208>])
- The build process incorrectly tried to overwrite `sql/lex_hash.h`. This caused the build to fail when using a shadow link tree pointing to original sources that were owned by another account. (Bug#18888 [<http://bugs.mysql.com/18888>])
- `mysql_ftdump` produced bad counts for common words. (Bug#22326 [<http://bugs.mysql.com/22326>])
- The optimizer could make an incorrect index choice for indexes with a skewed key distribution. (Bug#22393 [<http://bugs.mysql.com/22393>])
- When records are merged from the insert buffer and the page needs to be reorganized, `InnoDB` used incorrect column length information when interpreting the records of the page. This caused a server crash due to apparent corruption of secondary indexes in `ROW_FORMAT=COMPACT` that contain prefix indexes of fixed-length columns. Data files should not be corrupted, but the crash was likely

- to repeat every time the server was restarted. ([Bug#21638](http://bugs.mysql.com/21638) [<http://bugs.mysql.com/21638>])
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. ([Bug#12751](http://bugs.mysql.com/12751) [<http://bugs.mysql.com/12751>])
 - Using `GROUP_CONCAT()` on the result of a subquery in the `FROM` clause that itself used `GROUP_CONCAT()` could cause a server crash. ([Bug#22015](http://bugs.mysql.com/22015) [<http://bugs.mysql.com/22015>])
 - Instance Manager had a race condition involving `mysqld` PID file removal. ([Bug#22379](http://bugs.mysql.com/22379) [<http://bugs.mysql.com/22379>])
 - Execution of a prepared statement that uses an `IN` subquery with aggregate functions in the `HAVING` clause could cause a server crash. ([Bug#22085](http://bugs.mysql.com/22085) [<http://bugs.mysql.com/22085>])
 - Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. ([Bug#21617](http://bugs.mysql.com/21617) [<http://bugs.mysql.com/21617>], [Bug#22937](http://bugs.mysql.com/22937) [<http://bugs.mysql.com/22937>])
 - A locking safety check in `InnoDB` reported a spurious error `stored_select_lock_type is 0 inside ::start_stmt()` for `INSERT ... SELECT` statements in `innodb_locks_unsafe_for_binlog` mode. The safety check was removed. ([Bug#10746](http://bugs.mysql.com/10746) [<http://bugs.mysql.com/10746>])
 - `make install` tried to build files that should already have been built by `make all`, causing a failure if installation was performed using a different account than the one used for the initial build. ([Bug#19738](http://bugs.mysql.com/19738) [<http://bugs.mysql.com/19738>])
 - The source distribution would not build on Windows due to a spurious dependency on `ib_config.h`. ([Bug#22224](http://bugs.mysql.com/22224) [<http://bugs.mysql.com/22224>])
 - It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. ([Bug#21311](http://bugs.mysql.com/21311) [<http://bugs.mysql.com/21311>])
 - The server returns a more informative error message when it attempts to open a `MERGE` table that has been defined to use non-`MyISAM` tables. ([Bug#10974](http://bugs.mysql.com/10974) [<http://bugs.mysql.com/10974>])
 - Within stored routines, some error messages were printed incorrectly. A non-null-terminated string was passed to a message-printing routine that expected a null-terminated string. ([Bug#20778](http://bugs.mysql.com/20778) [<http://bugs.mysql.com/20778>])
 - `SUBSTR()` results sometimes were stored improperly into a temporary table when multi-byte character sets were used. ([Bug#20204](http://bugs.mysql.com/20204) [<http://bugs.mysql.com/20204>])
 - Certain malformed `INSERT` statements could crash the `mysql` client. ([Bug#21142](http://bugs.mysql.com/21142) [<http://bugs.mysql.com/21142>])
 - `EXPLAIN EXTENDED` now shows a `filtered` column that is an estimated percentage of the examined rows that will be joined with the previous tables. This was added while dealing with a problem of MySQL choosing the wrong index for some queries. ([Bug#14940](http://bugs.mysql.com/14940) [<http://bugs.mysql.com/14940>])
 - On Mac OS X, zero-byte `read()` or `write()` calls to an SMB-mounted filesystem could return a non-standard return value, leading to data corruption. Now such calls are avoided. ([Bug#12620](http://bugs.mysql.com/12620) [<http://bugs.mysql.com/12620>])
 - With `TRADITIONAL SQL` mode, assignment of out-of-bound values and rounding of assigned values was done correctly, but assignment of the same numbers represented as strings sometimes was handled differently. ([Bug#6147](http://bugs.mysql.com/6147) [<http://bugs.mysql.com/6147>])

- The source distribution failed to compile when configured with the `--without-geometry` option. (Bug#12991 [<http://bugs.mysql.com/12991>])
- The source distribution failed to compile when configured with the `--with-libwrap` option. (Bug#18246 [<http://bugs.mysql.com/18246>])
- The feature of being able to recover a temporary table named `#sql_id` in InnoDB by creating a table named `rsql_id_recover_innodb_tmp_table` was broken by the introduction of the new identifier encoding in MySQL 5.1.6 (Bug#21313 [<http://bugs.mysql.com/21313>])
- `ALTER EVENT` in the body of a stored procedure led to a crash when the procedure was called. This affected only those `ALTER EVENT` statements which changed the interval of the event. (Bug#22397 [<http://bugs.mysql.com/22397>])
- A `DATE` can be represented as an integer (such as `20060101`) or as a string (such as `'2006.01.01'`). When a `DATE` (or `TIME`) column is compared in one `SELECT` against both representations, constant propagation by the optimizer led to comparison of `DATE` as a string against `DATE` as an integer. This could result in integer comparisons such as `2006` against `20060101`, erroneously producing a false result. (Bug#21475 [<http://bugs.mysql.com/21475>])
- When a statement used a stored function that inserted into an `AUTO_INCREMENT` column, the generated `AUTO_INCREMENT` value was not written into the binary log, so a different value could in some cases be inserted on the slave. (Bug#20341 [<http://bugs.mysql.com/20341>])
- A stored procedure that used `LAST_INSERT_ID()` did not replicate properly using statement-based binary logging. (Bug#20339 [<http://bugs.mysql.com/20339>])
- Use of the `--no-pager` option caused `mysql` to crash. (Bug#19363 [<http://bugs.mysql.com/19363>])
- For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` within the `UPDATE` clause sometimes was handled incorrectly. (Bug#21555 [<http://bugs.mysql.com/21555>])
- When `event_scheduler` was set to `DISABLED`, its value was not displayed correctly by `SHOW VARIABLES` or `SELECT @@global.event_scheduler`. (Bug#22662 [<http://bugs.mysql.com/22662>])
- Row equalities (such as `WHERE (a,b) = (c,d)`) were not taken into account by the optimizer, resulting in slow query execution. Now they are treated as conjunctions of equalities between row elements. (Bug#16081 [<http://bugs.mysql.com/16081>])
- If the binary logging format was changed between the times when a locked table was modified and when it was unlocked, the binary log contents were incorrect. (Bug#20863 [<http://bugs.mysql.com/20863>])
- Column names supplied for a view created on a master server could be lost on a slave server. (Bug#19419 [<http://bugs.mysql.com/19419>])
- For a `MyISAM` table locked with `LOCK TABLES ... WRITE`, queries optimized using the `index_merge` method did not show rows inserted with the lock in place. (Bug#20256 [<http://bugs.mysql.com/20256>])
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. (Bug#21392 [<http://bugs.mysql.com/21392>])
- A query result could be sorted improperly when using `ORDER BY` for the second table in a join. (Bug#21302 [<http://bugs.mysql.com/21302>])
- The `--collation-server` server option was being ignored. With the fix for this problem, if

- you choose a non-default character set with `--character-set-server`, you should also use `--collation-server` to specify the collation. (Bug#15276 [http://bugs.mysql.com/15276])
- A function result in a comparison was replaced with a constant by the optimizer under some circumstances when this optimization was invalid. (Bug#21698 [http://bugs.mysql.com/21698])
 - A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. (Bug#21180 [http://bugs.mysql.com/21180])
 - If the `auto_increment_offset` setting causes MySQL to generate a value larger than the column's maximum possible value, the `INSERT` statement is accepted in strict SQL mode, whereas but should fail with an error. (Bug#20573 [http://bugs.mysql.com/20573])
 - Queries containing a subquery that used aggregate functions could return incorrect results. (Bug#16792 [http://bugs.mysql.com/16792])
 - Row-based replication failed when the query cache was enabled on the slave. (Bug#17620 [http://bugs.mysql.com/17620])
 - The `index_merge/Intersection` optimizer could have a memory overrun when the number of table columns covered by an index is sufficiently large, possibly resulting in a server crash. (Bug#16201 [http://bugs.mysql.com/16201])
 - The `MD5()`, `SHA1()`, and `ENCRYPT()` functions should return a binary string, but the result sometimes was converted to the character set of the argument. `MAKE_SET()` and `EXPORT_SET()` now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. (Bug#20536 [http://bugs.mysql.com/20536])
 - `EXPLAIN` sometimes returned an incorrect `select_type` for a `SELECT` from a view, compared to the `select_type` for the equivalent `SELECT` from the base table. (Bug#5500 [http://bugs.mysql.com/5500])
 - An `InnoDB` mutex was not aquired and released under the same condition, leading to deadlock in some rare situations involving XA transactions. (Bug#21833 [http://bugs.mysql.com/21833])
 - With row-based replication, replicating a statement to a slave where the table had additional columns relative to the master table did not work. (Bug#19069 [http://bugs.mysql.com/19069])
 - Use of `myisampack` or `myisamchk` on a table with `FULLTEXT` indexing resulted in table corruption. (Bug#19702 [http://bugs.mysql.com/19702])
 - With `max_sp_recursion` set to 0, a stored procedure that executed a `SHOW CREATE PROCEDURE` statement for itself triggered a recursion limit exceeded error, though the statement involves no recursion. (Bug#21416 [http://bugs.mysql.com/21416])
 - `mysqldump` did not add version-specific comments around `WITH PARSER` and `TABLESPACE ... STORAGE DISK` clauses for `CREATE TABLE` statements, causing the dump file to fail when loaded into older servers. (Bug#20841 [http://bugs.mysql.com/20841])
 - `BIN()`, `OCT()`, and `CONV()` did not work with `BIT` values. (Bug#15583 [http://bugs.mysql.com/15583])
 - The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithianian_ci`. (Bug#9509 [http://bugs.mysql.com/9509])
 - The server could crash for the second execution of a function containing a `SELECT` statement that uses an aggregating `IN` subquery. (Bug#21493 [http://bugs.mysql.com/21493])

- `UPGRADE` was treated as a reserved word, although it is not. ([Bug#21772](http://bugs.mysql.com/21772) [<http://bugs.mysql.com/21772>])
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were being truncated to 64 bytes. ([Bug#21432](http://bugs.mysql.com/21432) [<http://bugs.mysql.com/21432>])
- Usernames have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. ([Bug#20393](http://bugs.mysql.com/20393) [<http://bugs.mysql.com/20393>])
- A query could produce different results with and without an index, if the `WHERE` clause contained a range condition that used an invalid `DATETIME` constant. ([Bug#16249](http://bugs.mysql.com/16249) [<http://bugs.mysql.com/16249>])
- `COUNT(*)` queries with `ORDER BY` and `LIMIT` could return the wrong result. ([Bug#21787](http://bugs.mysql.com/21787) [<http://bugs.mysql.com/21787>])

Note: This problem was introduced by the fix for [Bug#9676](http://bugs.mysql.com/9676) [<http://bugs.mysql.com/9676>], which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to non-group queries with aggregate functions. The current fix disables the optimization in such cases.

- Memory overruns could occur for certain kinds of subqueries. ([Bug#21477](http://bugs.mysql.com/21477) [<http://bugs.mysql.com/21477>])
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. ([Bug#21456](http://bugs.mysql.com/21456) [<http://bugs.mysql.com/21456>])
- Memory used by scheduled events was not freed when the events were dropped. ([Bug#18683](http://bugs.mysql.com/18683) [<http://bugs.mysql.com/18683>])
- A scheduled event that took longer to execute than the length of time scheduled between successive executions could “skip” executions. For example, an event defined with `EVERY 1 SECOND` — but which required longer than 1 second to complete — might be executed only once every 2 seconds. ([Bug#16417](http://bugs.mysql.com/16417) [<http://bugs.mysql.com/16417>])
- When used in the `DO` clause of a `CREATE EVENT` statement, the statements `CREATE EVENT`, `CREATE FUNCTION`, and `CREATE PROCEDURE` caused the server to crash. (These statements are not permitted inside `CREATE EVENT`.) ([Bug#16409](http://bugs.mysql.com/16409) [<http://bugs.mysql.com/16409>], [Bug#18896](http://bugs.mysql.com/18896) [<http://bugs.mysql.com/18896>])
- A subselect used in the `ON SCHEDULE` clause of a `CREATE EVENT` or `ALTER EVENT` statement caused the server to crash, rather than producing an error as expected. ([Bug#16394](http://bugs.mysql.com/16394) [<http://bugs.mysql.com/16394>])
- `mysql` displayed an empty string for `NULL` values. ([Bug#21618](http://bugs.mysql.com/21618) [<http://bugs.mysql.com/21618>])
- `mysql_upgrade` produced a malformed `upgrade_defaults` file by overwriting the `[client]` group header with a `password` option. This prevented `mysqlcheck` from running successfully when invoked by `mysql_upgrade`. ([Bug#21011](http://bugs.mysql.com/21011) [<http://bugs.mysql.com/21011>])
- `mysql_config --libmysqld-libs` did not produce any SSL options necessary for linking `libmysqld` with SSL support enabled. ([Bug#21239](http://bugs.mysql.com/21239) [<http://bugs.mysql.com/21239>])
- `yaSSL` had a conflicting definition for `socklen_t` on `hurd-i386` systems. ([Bug#22326](http://bugs.mysql.com/22326) [<http://bugs.mysql.com/22326>])
- On Windows, inserting into a `MERGE` table after renaming an underlying `MyISAM` table caused a server crash. ([Bug#20789](http://bugs.mysql.com/20789) [<http://bugs.mysql.com/20789>])

- `character_set_results` can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. (Bug#21913 [<http://bugs.mysql.com/21913>])
- If a partitioned `InnoDB` table contained an `AUTO_INCREMENT` column, a `SHOW` statement could cause an assertion failure with more than one connection. (Bug#20493 [<http://bugs.mysql.com/20493>])
- Running `InnoDB` with many concurrent threads could cause memory corruption and a seg fault due to a bug introduced in MySQL 5.1.11. (Bug#20213 [<http://bugs.mysql.com/20213>])
- Using `DROP TABLE` with concurrent queries causes `mysqld` to crash. (Bug#21784 [<http://bugs.mysql.com/21784>])
- The `ExtractValue()` function did not accept XML tag names containing a period (.) character. (Bug#20795 [<http://bugs.mysql.com/20795>])
- Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'binlog truncated in the middle of event'` errors on the slave. (Bug#4053 [<http://bugs.mysql.com/4053>])
- For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. (Bug#17939 [<http://bugs.mysql.com/17939>])
- Identifiers with embedded escape characters were not handled correctly by some `SHOW` statements due to some old code that was doing some extra unescaping. (Bug#19874 [<http://bugs.mysql.com/19874>])
- `InnoDB` was slow with more than 100,000 `.idb` files. (Bug#21112 [<http://bugs.mysql.com/21112>])
- `SHOW INNODB STATUS` contained some duplicate output. (Bug#21113 [<http://bugs.mysql.com/21113>])
- After an `INSERT ... ON DUPLICATE KEY UPDATE` statement that updated an existing row, `LAST_INSERT_ID()` could return a value not in the table. (Bug#11460 [<http://bugs.mysql.com/11460>])
- Selecting from `INFORMATION_SCHEMA.FILES` could crash the server. (Bug#21676 [<http://bugs.mysql.com/21676>])
- Using cursors with `READ COMMITTED` isolation level could cause `InnoDB` to crash. (Bug#19834 [<http://bugs.mysql.com/19834>])
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available. (Bug#9678 [<http://bugs.mysql.com/9678>])
- Using `ALTER TABLE ... REORGANIZE PARTITIONS` to reduce the number of subpartitions to 1 caused the server to crash. (Bug#21210 [<http://bugs.mysql.com/21210>])
- `NDB Cluster` (Disk Data): The `INFORMATION_SCHEMA.FILES` table showed incorrect values in the `EXTENT_SIZE`, `FREE_EXTENTS`, and `TOTAL_EXTENTS` columns for UNDO logfiles. (Bug#20073 [<http://bugs.mysql.com/20073>])
- `NDB Cluster` (Disk Data): Deletes from Disk Data tables used a non-optimal scan to find the rows to be deleted, resulting in poor performance. The fix causes disk order rather than memory order to be used, and can improve performance of Disk Data deletes by up to ~300% in some cases. (Bug#17929 [<http://bugs.mysql.com/17929>])
- `NDB Cluster`: A scan timeout returned Error 4028 (Node failure caused abort of transaction) in-

stead of Error 4008 (Node failure caused abort of transaction...). ([Bug#21799](http://bugs.mysql.com/21799))

- **NDB Cluster**: The message Error 0 in readAutoIncrementValue(): no Error was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column. ([Bug#21033](http://bugs.mysql.com/21033))
- **NDB Cluster** (Direct APIs): The `storage/ndb` directory was missing from the server binary distribution, making it impossible to compile NDB API and MGM API applications. This directory can be found as `/usr/include/storage/ndb` after installing that distribution. ([Bug#21955](http://bugs.mysql.com/21955))
- **NDB Cluster**: `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. ([Bug#20426](http://bugs.mysql.com/20426))
- The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. ([Bug#21058](http://bugs.mysql.com/21058))
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. ([Bug#13717](http://bugs.mysql.com/13717))
- If a column definition contained a character set declaration, but a `DEFAULT` value began with an introducer, the introducer character set was used as the column character set. ([Bug#20695](http://bugs.mysql.com/20695))
- If a query had a condition of the form `tableX.key = tableY.key`, which participated in equality propagation and also was used for `ref` access, then early `ref`-access `NULL` filtering was not performed for the condition. This could make query execution slower. ([Bug#19649](http://bugs.mysql.com/19649))
- The optimizer sometimes produced an incorrect row-count estimate after elimination of `const` tables. This resulted in choosing extremely inefficient execution plans in some cases when distribution of data in joins were skewed. ([Bug#21390](http://bugs.mysql.com/21390))
- Query results could be incorrect if the `WHERE` clause contained `t.key_part NOT IN (val_list)`, where `val_list` is a list of more than 1000 constants. ([Bug#21282](http://bugs.mysql.com/21282))
- `STR_TO_DATE()` sometimes would return `NULL` if the `%D` format specifier was not the last specifier in the format string. ([Bug#20987](http://bugs.mysql.com/20987))
- On Windows, a definition for `mysql_set_server_option()` was missing from the C client library. ([Bug#16513](http://bugs.mysql.com/16513))
- The `myisam_stats_method` variable was mishandled when set from an option file or on the command line. ([Bug#21054](http://bugs.mysql.com/21054))
- The optimizer assumed that if `(a=x AND b=x)` is true, `(a=x AND b=x) AND a=b` is also true. But that is not always so if `a` and `b` have different data types. ([Bug#21159](http://bugs.mysql.com/21159))
- **InnoDB** did not honor `IGNORE INDEX`, which prevented using `IGNORE INDEX` in cases where an index sort would be slower than a filesort. ([Bug#21174](http://bugs.mysql.com/21174))
- For connections that required a `SUBJECT` value, a check was performed to verify that the value was correct, but the connection was not refused if not. ([Bug#20411](http://bugs.mysql.com/20411))
- Some Linux-x86_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only

ICC builds are affected, not gcc builds. Solaris and FreeBSD x86_64 builds are not affected. ([Bug#22238](http://bugs.mysql.com/22238) [<http://bugs.mysql.com/22238>])

- `INSERT ... SELECT` sometimes generated a spurious `Column count doesn't match value count` error. ([Bug#21774](http://bugs.mysql.com/21774) [<http://bugs.mysql.com/21774>])
- Some user-level level errors were being written to the server's error log, which is for server errors. ([Bug#20402](http://bugs.mysql.com/20402) [<http://bugs.mysql.com/20402>])
- to the client could have an empty column name. When using tables created under MySQL 4.1 with a 5.0 server, if the tables contained `VARCHAR` columns, for some queries the metadata sent to the client could have an empty column name. ([Bug#14897](http://bugs.mysql.com/14897) [<http://bugs.mysql.com/14897>])
- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. ([Bug#19741](http://bugs.mysql.com/19741) [<http://bugs.mysql.com/19741>])
- `ORDER BY RAND() LIMIT 1` always set a user variable to the last possible value from the table. ([Bug#16861](http://bugs.mysql.com/16861) [<http://bugs.mysql.com/16861>])
- `N'xxx'` and `_utf8'xxx'` were not treated as equivalent because `N'xxx'` failed to unescape backslashes (`\`) and doubled apostrophe/single quote characters (`'`). ([Bug#17313](http://bugs.mysql.com/17313) [<http://bugs.mysql.com/17313>])
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. ([Bug#16255](http://bugs.mysql.com/16255) [<http://bugs.mysql.com/16255>])
- When `NOW()` was used in a `BETWEEN` clause of the definition for a view, it was replaced with a constant in the view. ([Bug#15950](http://bugs.mysql.com/15950) [<http://bugs.mysql.com/15950>])
- A stored procedure with a `CONTINUE` handler that encountered an error continued to execute a statement that caused an error, rather with the next statement following the the one that caused the error. ([Bug#8153](http://bugs.mysql.com/8153) [<http://bugs.mysql.com/8153>])
- `libmysqlclient` defined a symbol `BN_bin2bn` which belongs to OpenSSL. This could break applications that also linked against OpenSSL's `libcrypto` library. The fix required correcting an error in a build script that was failing to add rename macros for some functions. ([Bug#21930](http://bugs.mysql.com/21930) [<http://bugs.mysql.com/21930>])
- Queries that used the `index_merge` and `sort_union` methods to access an `InnoDB` table could produce inaccurate results. This issue was introduced in MySQL 5.1.10 when a new handler and bitmap interface was implemented. ([Bug#21277](http://bugs.mysql.com/21277) [<http://bugs.mysql.com/21277>])
- The `SELECT` privilege was required for an insert on a view, instead of the `INSERT` privilege. ([Bug#21261](http://bugs.mysql.com/21261) [<http://bugs.mysql.com/21261>])

Note: This fixes a regression that was introduced by the fix for [Bug#20989](http://bugs.mysql.com/20989) [<http://bugs.mysql.com/20989>].

- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. ([Bug#21965](http://bugs.mysql.com/21965) [<http://bugs.mysql.com/21965>])
- Building `mysql` on Windows with CMake 2.4 would fail to create `libmysqld` correctly. ([Bug#20907](http://bugs.mysql.com/20907) [<http://bugs.mysql.com/20907>])
- The server's handling of the number of partitions or subpartitions specified in a `PARTITIONS` or `SUBPARTITIONS` clause was changed. Beginning with this release, the number of partitions must:
 - be a positive, non-zero integer

- not have any leading zeroes
- not be an expression

Also beginning with this version, no attempt is made to convert, truncate, or evaluate a `PARTITIONS` or `SUBPARTITIONS` value; instead, the `CREATE TABLE` or `ALTER TABLE` statement containing the `PARTITIONS` or `SUBPARTITIONS` clause now fails with an appropriate error message. ([Bug#15890](http://bugs.mysql.com/15890) [<http://bugs.mysql.com/15890>])

- A misleading error message was displayed when attempting to define a unique key that was not valid for a partitioned table. ([Bug#21862](http://bugs.mysql.com/21862) [<http://bugs.mysql.com/21862>])
- Errors could be generated during the execution of certain prepared statements that ran queries on partitioned tables. ([Bug#21658](http://bugs.mysql.com/21658) [<http://bugs.mysql.com/21658>])
- Using relative paths for `DATA DIRECTORY` or `INDEX DIRECTORY` with a partitioned table generated a warning rather than an error, and caused “junk” files to be created in the server's data directory. ([Bug#21350](http://bugs.mysql.com/21350) [<http://bugs.mysql.com/21350>])
- Using `EXPLAIN PARTITIONS` with a query on a table whose partitioning expression was based on the value of a `DATE` column could sometimes cause the server to crash. ([Bug#21339](http://bugs.mysql.com/21339) [<http://bugs.mysql.com/21339>])
- Running `SHOW TABLE STATUS` on any `InnoDB` table having at least one record could crash the server. Note that this was not due to any issue in the `InnoDB` storage engine, but rather with `AUTO_INCREMENT` handling in the partitioning code — however, the table did not have to have an `AUTO_INCREMENT` column for the bug to manifest. ([Bug#21173](http://bugs.mysql.com/21173) [<http://bugs.mysql.com/21173>])
- Some `ALTER TABLE` statements affecting a table's subpartitioning could hang. ([Bug#21143](http://bugs.mysql.com/21143) [<http://bugs.mysql.com/21143>])
- Scheduled events that invoked stored procedures executing DDL operations on partitioned tables could crash the server. ([Bug#20548](http://bugs.mysql.com/20548) [<http://bugs.mysql.com/20548>])
- The `yaSSL` library bundled with `libmysqlclient` had some conflicts with `OpenSSL`. Now macros are used to rename the conflicting symbols to have a prefix of `ya`. ([Bug#19810](http://bugs.mysql.com/19810) [<http://bugs.mysql.com/19810>])
- It is possible to create `MERGE` tables into which data cannot be inserted (by not specifying a `UNION` clause). However, when an insert was attempted, the error message was confusing. Now an error occurs indicating that the table is read-only. ([Bug#17766](http://bugs.mysql.com/17766) [<http://bugs.mysql.com/17766>])
- User-created tables having a name beginning with `#sql` were not visible to `SHOW TABLES` and could collide with internal temporary table names. Now they are not hidden and do not collide. ([Bug#1405](http://bugs.mysql.com/1405) [<http://bugs.mysql.com/1405>])
- A `NUL` byte within a prepared statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. ([Bug#21813](http://bugs.mysql.com/21813) [<http://bugs.mysql.com/21813>])
- `mysql_upgrade` created temporary files in a possibly insecure way. ([Bug#21224](http://bugs.mysql.com/21224) [<http://bugs.mysql.com/21224>])
- Some prepared statements caused a server crash when executed a second time. ([Bug#21166](http://bugs.mysql.com/21166) [<http://bugs.mysql.com/21166>])
- With `query_cache_type` set to 0, `RESET QUERY CACHE` was very slow and other threads were blocked during the operation. Now a cache reset is faster and non-blocking. ([Bug#21051](http://bugs.mysql.com/21051) [<http://bugs.mysql.com/21051>])

- When `DROP DATABASE` or `SHOW OPEN TABLES` was issued while concurrently issuing `DROP TABLE` (or `RENAME TABLE`, `CREATE TABLE LIKE` or any other statement that required a name lock) in another connection, the server crashed. (Bug#19403 [<http://bugs.mysql.com/19403>], Bug#21216 [<http://bugs.mysql.com/21216>])
- Use of zero-length variable names caused a server crash. (Bug#20908 [<http://bugs.mysql.com/20908>])
- Prepared statements caused general log and server memory corruption. (Bug#14346 [<http://bugs.mysql.com/14346>])
- `mysqldump` incorrectly tried to use `LOCK TABLES` for tables in the `INFORMATION_SCHEMA` database. (Bug#21527 [<http://bugs.mysql.com/21527>])
- Use of the `--prompt` option or `prompt` command caused `mysql` to be unable to connect to the Instance Manager. (Bug#17485 [<http://bugs.mysql.com/17485>])
- The server crashed if it tried to access a `CSV` table for which the data file had been removed. (Bug#15205 [<http://bugs.mysql.com/15205>])
- `CREATE USER` did not respect the 16-character username limit. (Bug#10668 [<http://bugs.mysql.com/10668>])
- Creating a partitioned table that used the `InnoDB` storage engine and then restarting `mysqld` with `--skip-innodb` caused MySQL to crash. (Bug#20871 [<http://bugs.mysql.com/20871>])
- In mixed-format binary logging mode, stored functions, triggers, and views that use functions in their body that require row-based logging did not replicate reliably because the logging did not switch from statement-based to row-based format. For example, `INSERT INTO t SELECT FROM v`, where `v` is a view that selects `UUID()` could cause problems. This limitation has been removed. (Bug#20930 [<http://bugs.mysql.com/20930>])
- For user-defined functions created with `CREATE FUNCTION`, the `DEFINER` clause is not legal, but no error was generated. (Bug#21269 [<http://bugs.mysql.com/21269>])
- `mysqld --flush` failed to flush changes to disk following an `UPDATE` statement for which no updated column had an index. (Bug#20060 [<http://bugs.mysql.com/20060>])
- In mixed-format binary logging mode, stored functions, triggers, and views that use functions in their body that require row-based logging did not replicate reliably because the logging did not switch from statement-based to row-based format. For example, `INSERT INTO t SELECT FROM v`, where `v` is a view that selects `UUID()` could cause problems. This limitation has been removed. (Bug#20930 [<http://bugs.mysql.com/20930>])
- When not running in strict mode, the server failed to convert the invalid years portion of a `DATE` or `DATETIME` value to `'0000'` when inserting it into a table. (Bug#19370 [<http://bugs.mysql.com/19370>])
- The dropping of a temporary table whose name contained a backtick (```) character was not correctly written to the binary log, which also caused it not to be replicated correctly. (Bug#19188 [<http://bugs.mysql.com/19188>])
- Setting `myisam_repair_threads` caused any repair operation on the table to fail to update the cardinality of indexes, instead making them always equal to 1. (Bug#18874 [<http://bugs.mysql.com/18874>])
- Intermediate tables created during the execution of an `ALTER TABLE` statement were visible in the output of `SHOW TABLES`. (Bug#18775 [<http://bugs.mysql.com/18775>])

- When setting a column to its implicit default value as the result of inserting a `NULL` into a `NOT NULL` column as part of a multi-row insert or `LOAD DATA` operation, the server returned a misleading warning message. (Bug#14770 [<http://bugs.mysql.com/14770>])
- The `--with-collation` option was not honored for client connections. (Bug#7192 [<http://bugs.mysql.com/7192>])
- Users who had the `SHOW VIEW` privilege for a view and privileges on one of the view's base table could not see records in `INFORMATION_SCHEMA` tables relating to the base table. (Bug#20543 [<http://bugs.mysql.com/20543>])
- An issue with yaSSL prevented Connector/J clients from connecting to the server using a certificate. (Bug#19705 [<http://bugs.mysql.com/19705>])
- Some server errors were not reported to the client, causing both to try to read from the connection until a hang or crash resulted. (Bug#16581 [<http://bugs.mysql.com/16581>])
- `FEDERATED` tables raised invalid duplicate key errors when attempting on one server to insert rows having the same primary key values as rows that had been deleted from the linked table on the other server. (Bug#18764 [<http://bugs.mysql.com/18764>])
- The C API failed to return a status message when invoking a stored procedure. (Bug#15752 [<http://bugs.mysql.com/15752>])
- `AUTHORS` and `CONTRIBUTORS` were not treated as reserved words. (Bug#19939 [<http://bugs.mysql.com/19939>])
- Stored procedures did not use the character set defined for the database in which they were created. (Bug#16676 [<http://bugs.mysql.com/16676>])
- `CREATE PROCEDURE`, `CREATE FUNTION`, `CREATE TRIGGER`, and `CREATE VIEW` statements containing multi-line comments (`/* . . . */`) could not be replicated. (Bug#20438 [<http://bugs.mysql.com/20438>])
- The final parenthesis of a `CREATE INDEX` statement occurring in a stored procedure was omitted from the binary log when the stored procedure was called. (Bug#19207 [<http://bugs.mysql.com/19207>])
- Attempting to insert a string of greater than 4096 bytes into a `FEDERATED` table resulted in the error `ERROR 1296 (HY000) at line 2: Got error 10000 'Error on remote system: 1054: Unknown column 'string-value' from FEDERATED. This error was raised regardless of the type of column involved (VARCHAR, TEXT, and so on.)` (Bug#17608 [<http://bugs.mysql.com/17608>])
- Performance during an import on a table with a trigger that called a stored procedure was severely degraded. (Bug#21013 [<http://bugs.mysql.com/21013>])
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. (Bug#19399 [<http://bugs.mysql.com/19399>])
- On 64-bit Windows, a missing table generated error 1017, not the correct value of 1146. (Bug#21396 [<http://bugs.mysql.com/21396>])
- The same trigger error message was produced under two conditions: The trigger duplicated an existing trigger name, or the trigger duplicated an existing combination of action and event. Now different messages are produced for the two conditions so as to be more informative. (Bug#10946 [<http://bugs.mysql.com/10946>])
- The value returned by a stored function returning a string value was not of the declared character set. (Bug#16211 [<http://bugs.mysql.com/16211>])

- `FLUSH TABLES` followed by a `LOCK TABLES` statement to lock a log table and a non-log table caused an infinite loop and high CPU use. Now `FLUSH TABLES` ignores log tables. To flush the log tables, use `FLUSH LOGS` instead. (Bug#20139 [<http://bugs.mysql.com/20139>])
- If a filename was specified for the `--log` or `--log-slow_queries` options but the server was logging to tables and not files, the server produced no error message. (Bug#17599 [<http://bugs.mysql.com/17599>])
- `mysqlcheck` tried to check views instead of ignoring them. (Bug#16502 [<http://bugs.mysql.com/16502>])
- Long multiple-row `INSERT` statements could take a very long time for some multi-byte character sets. (Bug#15811 [<http://bugs.mysql.com/15811>])
- For `mysql`, escaping with backslash sometimes did not work. (Bug#20103 [<http://bugs.mysql.com/20103>])
- Under certain circumstances, `AVG(key_val)` returned a value but `MAX(key_val)` returned an empty set due to incorrect application of `MIN()`/`MAX()` optimization. (Bug#20954 [<http://bugs.mysql.com/20954>])
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()`/`MAX()` optimization. (Bug#20792 [<http://bugs.mysql.com/20792>])
- A query using `WHERE column = constant OR column IS NULL` did not return consistent results on successive invocations. The `column` in each part of the `WHERE` clause could be either the same column, or two different columns, for the effect to be observed. (Bug#21091 [<http://bugs.mysql.com/21091>])
- The `PASSWORD()` function returned invalid results when used in some `UNION` queries. (Bug#16881 [<http://bugs.mysql.com/16881>])
- `USE` did not refresh database privileges when employed to re-select the current database. (Bug#10979 [<http://bugs.mysql.com/10979>])
- A query using `WHERE NOT (column < ANY (subquery))` yielded a different result from the same query using the same `column` and `subquery` with `WHERE (column > ANY (subquery))`. (Bug#20975 [<http://bugs.mysql.com/20975>])
- A user variable set to a value selected from an unsigned column was stored as a signed value. (Bug#7498 [<http://bugs.mysql.com/7498>])
- `SELECT` statements using `GROUP BY` against a view could have missing columns in the output when there was a trigger defined on one of the base tables for the view. (Bug#20466 [<http://bugs.mysql.com/20466>])
- A `SELECT` with a subquery that was bound to the outer query over multiple columns returned different results when a constant was used instead of one of the dependant columns. (Bug#18925 [<http://bugs.mysql.com/18925>])
- `InnoDB`: Quoted Unicode identifiers were not handled correctly. This included names of tables, columns, and foreign keys. (Bug#18800 [<http://bugs.mysql.com/18800>])
- A stored procedure that created and invoked a prepared statement was not executed when called in a `mysqld` init-file. (Bug#17843 [<http://bugs.mysql.com/17843>])
- Using the extended syntax for `TRIM()` — that is, `TRIM(... FROM ...)` — in a `SELECT` statement defining a view caused an invalid syntax error when selecting from the view. (Bug#17526 [<http://bugs.mysql.com/17526>])

- Assignments of values to variables of type `TEXT` were handled incorrectly in stored routines. ([Bug#17225](http://bugs.mysql.com/17225) [http://bugs.mysql.com/17225])
- When performing a `GROUP_CONCAT ()`, the server transformed `BLOB` columns `VARCHAR` columns, which could cause erroneous results when using Connector/J and possibly other MySQL APIs. ([Bug#16712](http://bugs.mysql.com/16712) [http://bugs.mysql.com/16712])
- The type of the value returned by the `VARIANCE ()` function varied according to the type of the input value. The function should always return a `DOUBLE` value. ([Bug#10966](http://bugs.mysql.com/10966) [http://bugs.mysql.com/10966])
- Performing an `INSERT` on a view that was defined using a `SELECT` that specified a collation and a column alias caused the server to crash ([Bug#21086](http://bugs.mysql.com/21086) [http://bugs.mysql.com/21086]).

- A query of the form shown here caused the server to crash:

```
SELECT * FROM t1 NATURAL JOIN (
  t2 JOIN (
    t3 NATURAL JOIN t4,
    t5 NATURAL JOIN t6
  )
  ON (t3.id3 = t2.id3 AND t5.id5 = t2.id5)
);
```

([Bug#21007](http://bugs.mysql.com/21007) [http://bugs.mysql.com/21007])

- `mysiam_ftdump` would fail when trying to open a MyISAM index file that you did not have write permissions to access, even though the command would only be reading from the file. ([Bug#17122](http://bugs.mysql.com/17122) [http://bugs.mysql.com/17122])
- `REPLACE . . . SELECT` for a view required the `INSERT` privilege for tables other than the table being modified. ([Bug#20989](http://bugs.mysql.com/20989) [http://bugs.mysql.com/20989])
- `mysqldump` sometimes did not select the correct database before trying to dump views from it, resulting in an empty result set that caused `mysqldump` to die with a segmentation fault. ([Bug#21014](http://bugs.mysql.com/21014) [http://bugs.mysql.com/21014])
- With mixed-format binary logging, `INSERT DELAYED` statements were logged using statement-based logging, and they did not replicate properly for statements that used values such as `UUID ()`, `RAND ()`, or user-defined variables that require row-based logging. To correct this, the `DELAYED` handler thread now switches to row-based logging if the logging format is mixed. ([Bug#20633](http://bugs.mysql.com/20633) [http://bugs.mysql.com/20633], [Bug#20649](http://bugs.mysql.com/20649) [http://bugs.mysql.com/20649])
- Using `EXPLAIN PARTITIONS` with a `UNION` query could crash the server. This could occur whether or not the query actually used any partitioned tables. ([Bug#20484](http://bugs.mysql.com/20484) [http://bugs.mysql.com/20484])
- Partition pruning could cause incorrect results from queries, such missing rows, when the partitioning expression relied on a `BIGINT UNSIGNED` column. ([Bug#20257](http://bugs.mysql.com/20257) [http://bugs.mysql.com/20257])
- The implementation for `UNCOMPRESS ()` did not indicate that it could return `NULL`, causing the optimizer to do the wrong thing. ([Bug#18539](http://bugs.mysql.com/18539) [http://bugs.mysql.com/18539])
- `TIMESTAMPDIFF ()` examined only the date and ignored the time when the requested difference unit was months or quarters. ([Bug#16226](http://bugs.mysql.com/16226) [http://bugs.mysql.com/16226])
- `perror` did not properly report `NDB` error codes. ([Bug#16561](http://bugs.mysql.com/16561) [http://bugs.mysql.com/16561])
- `mysqlimport` sends a `set @@character_set_database=binary` statement to the serv-

er, but this is not understood by pre-4.1 servers. Now `mysqlimport` encloses the statement within a `/*!40101 ... */` comment so that old servers will ignore it. (Bug#15690 [http://bugs.mysql.com/15690])

- The character set was not being properly initialized for `CAST()` with a type like `CHAR(2) BINARY`, which resulted in incorrect results or even a server crash. (Bug#17903 [http://bugs.mysql.com/17903])
- For ODBC compatibility, MySQL supports use of `WHERE col_name IS NULL` for `DATE` or `DATETIME` columns that are `NOT NULL`, to allow column values of `'0000-00-00'` or `'0000-00-00 00:00:00'` to be selected. However, this was not working for `WHERE` clauses in `DELETE` statements. (Bug#8143 [http://bugs.mysql.com/8143])
- The `--master-data` option for `mysqldump` requires certain privileges, but `mysqldump` generated a truncated dump file without producing an appropriate error message or exit status if the invoking user did not have those privileges. (Bug#21215 [http://bugs.mysql.com/21215])
- `ALTER VIEW` did not retain existing values of attributes that had been originally specified but were not changed in the `ALTER VIEW` statement. (Bug#21080 [http://bugs.mysql.com/21080])
- `mysql` crashed for very long arguments to the `connect` command. (Bug#21042 [http://bugs.mysql.com/21042])
- `pererror` crashed on Solaris due to `NULL` return value of `strerror()` system call. (Bug#20145 [http://bugs.mysql.com/20145])
- The `query` command for `mysqltest` did not work. (Bug#19890 [http://bugs.mysql.com/19890])
- For certain queries, the server incorrectly resolved a reference to an aggregate function and crashed. (Bug#20868 [http://bugs.mysql.com/20868])
- When executing a `SELECT` with `ORDER BY` on a view that is constructed from a `SELECT` statement containing a stored function, the stored function was evaluated too many times. (Bug#19862 [http://bugs.mysql.com/19862])
- A `SELECT` that used a subquery in the `FROM` clause that did not select from a table failed when the subquery was used in a join. (Bug#21002 [http://bugs.mysql.com/21002])
- Subqueries on `INFORMATION_SCHEMA` tables could erroneously return an empty result. (Bug#21231 [http://bugs.mysql.com/21231])
- Issuing a `SHOW CREATE FUNCTION` or `SHOW CREATE PROCEDURE` statement without sufficient privileges could crash the `mysql` client. (Bug#20664 [http://bugs.mysql.com/20664])
- In a view defined with `SQL SECURITY DEFINER`, the `CURRENT_USER()` function returned the invoker, not the definer. (Bug#20570 [http://bugs.mysql.com/20570])
- `DATE_ADD()` and `DATE_SUB()` returned `NULL` when the result date was on the day `'9999-12-31'`. (Bug#12356 [http://bugs.mysql.com/12356])
- For a `DATE` parameter sent via a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read-only. (Bug#20152 [http://bugs.mysql.com/20152])
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. (Bug#8706 [http://bugs.mysql.com/8706])
- If the files for an open table were removed at the OS level (external to the server), the server exited with an assertion failure. (Bug#16532 [http://bugs.mysql.com/16532])

- Some memory leaks in the `libmysqld` embedded server were corrected. (Bug#16017 [<http://bugs.mysql.com/16017>])
- With the `auto_increment_increment` system variable set larger than 1, if the next generated `AUTO_INCREMENT` value would be larger than the column's maximum value, the value would be clipped down to that maximum value and inserted, even if the resulting value would not be in the generated sequence. This could cause problems for master-master replication. Now the server clips the value down to the previous value in the sequence, which correctly produces a duplicate-key error if that value already exists in the column. (Bug#20524 [<http://bugs.mysql.com/20524>])
- If a table on a slave server had a higher `AUTO_INCREMENT` counter than the corresponding master table (even though all rows of the two tables were identical), in some cases `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` would not replicate properly using statement-based logging. (Different values would be inserted on the master and slave.) (Bug#20188 [<http://bugs.mysql.com/20188>])
- `mysqlslap` did not enable the `CLIENT_MULTI_RESULTS` flag when connecting, which is necessary for executing stored procedures. (Bug#20365 [<http://bugs.mysql.com/20365>])
- When creating a table using `CREATE ... SELECT` and a stored procedure, there would be a mismatch between the binary log and transaction cache which would cause a server crash. (Bug#21039 [<http://bugs.mysql.com/21039>])
- When run with the `--use-threads` option, `mysqlimport` returned a random exit code. (Bug#21188 [<http://bugs.mysql.com/21188>])
- The effect of a stored function or trigger that caused `AUTO_INCREMENT` values to be generated for multiple tables was not logged properly if statement-based logging was used. Only the first table's value was logged, causing replication to fail. Under mixed logging format, this is dealt with by switching to row-based logging for the function or trigger. For statement-based logging, this remains a problem. (Bug#19630 [<http://bugs.mysql.com/19630>])
- Changing the definition of a `DECIMAL` column with `ALTER TABLE` caused loss of column values. (Bug#18014 [<http://bugs.mysql.com/18014>])
- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption. Use of more than 1024 simultaneous cursors server wide also could lead to memory corruption. (This applies both to stored procedure and C API cursors.) (Bug#21206 [<http://bugs.mysql.com/21206>])
- A race condition during slave server shutdown caused an assert failure. (Bug#20850 [<http://bugs.mysql.com/20850>])
- `mysqldump` produced a malformed dump file when dumping multiple databases that contained views. (Bug#20221 [<http://bugs.mysql.com/20221>])
- Partitions were represented internally as the wrong data type, which led in some cases to failures of queries such as `SELECT COUNT(*) FROM INFORMATION_SCHEMA.PARTITIONS WHERE PARTITION_NAME = 'partition_name'`. (Bug#20340 [<http://bugs.mysql.com/20340>])
- Searches against a `ZEROFILL` column of a partitioned table could fail when the `ZEROFILL` column was part of the table's partitioning key. (Bug#20733 [<http://bugs.mysql.com/20733>])
- In mixed binary logging mode, a temporary switch from statement-based logging to row-based logging occurs when storing a row that uses a function such as `UUID()` into a temporary table. However, temporary table changes are not written to the binary log under row-based logging, so the row does not exist on the slave. A subsequent select from the temporary table to a non-temporary table using statement-based logging works correctly on the master, but not on the slave where the row

does not exist. The fix for this is that replication does not switch back from row-based logging to statement-based logging until there are no temporary tables for the session. ([Bug#20499](#) [<http://bugs.mysql.com/20499>])

- Re-executing a stored procedure with a complex stored procedure cursor query could lead to a server crash. ([Bug#15217](#) [<http://bugs.mysql.com/15217>])
- Views created from prepared statements inside of stored procedures were created with a definition that included both `SQL_CACHE` and `SQL_NO_CACHE`. ([Bug#17203](#) [<http://bugs.mysql.com/17203>])
- Updating a column of a `FEDERATED` table to `NULL` sometimes failed. ([Bug#16494](#) [<http://bugs.mysql.com/16494>])
- Performing `INSERT ... SELECT ... JOIN ... USING` without qualifying the column names caused `ERROR 1052 "column 'x' in field list is ambiguous"` even in cases where the column references were unambiguous. ([Bug#18080](#) [<http://bugs.mysql.com/18080>])
- Closing of temporary tables failed if binary logging was not enabled. ([Bug#20919](#) [<http://bugs.mysql.com/20919>])
- For statements that have a `DEFINER` clause such as `CREATE TRIGGER` or `CREATE VIEW`, long usernames or hostnames could cause a buffer overflow. ([Bug#16899](#) [<http://bugs.mysql.com/16899>])
- `mysqldump` would not dump views that had become invalid because a table named in the view definition had been dropped. Instead, it quit with an error message. Now you can specify the `--force` option to cause `mysqldump` to keep going and write a SQL comment containing the view definition to the dump output. ([Bug#17371](#) [<http://bugs.mysql.com/17371>])
- `InnoDB` (Partitioning): Updating an `InnoDB` table using `HASH` partitioning with a composite primary key would cause the server to hang. ([Bug#20852](#) [<http://bugs.mysql.com/20852>])
- Old partition and subpartition files were not always removed following `ALTER TABLE ... REORGANIZE PARTITION` statements. ([Bug#20770](#) [<http://bugs.mysql.com/20770>])
- Merging multiple partitions having subpartitions into a single partition with subpartitions, or splitting a single partition having subpartitions into multiple partitions with subpartitions, could sometimes crash the server. These issues were associated with a failure reported in the `partition_range` test. ([Bug#20766](#) [<http://bugs.mysql.com/20766>], [Bug#20767](#) [<http://bugs.mysql.com/20767>], [Bug#20893](#) [<http://bugs.mysql.com/20893>], [Bug#21357](#) [<http://bugs.mysql.com/21357>])
- Some queries using `ORDER BY ... DESC` on subpartitioned tables could crash the server. ([Bug#20389](#) [<http://bugs.mysql.com/20389>])
- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. ([Bug#18444](#) [<http://bugs.mysql.com/18444>])
- For `NDB` and possibly `InnoDB` tables, a `BEFORE UPDATE` trigger could insert incorrect values. ([Bug#18437](#) [<http://bugs.mysql.com/18437>])
- For multiple `INSERT DELAYED` statements executed in a batch by the delayed-insert handler thread, not all rows were written to the binary log. ([Bug#20821](#) [<http://bugs.mysql.com/20821>])
- Triggers on tables in the `mysql` database caused a server crash. Triggers for tables in this database now are disallowed. ([Bug#18005](#) [<http://bugs.mysql.com/18005>], [Bug#18361](#) [<http://bugs.mysql.com/18361>])
- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained

- any multi-byte characters, and rows could be missing from the result set. ([Bug#16674](#) [<http://bugs.mysql.com/16674>], [Bug#18359](#) [<http://bugs.mysql.com/18359>])
- Very complex `SELECT` statements could create temporary tables that were too big, but for which the temporary files did not get removed, causing subsequent queries to fail. ([Bug#11824](#) [<http://bugs.mysql.com/11824>])
 - Multiple-table updates with `FEDERATED` tables could cause a server crash. ([Bug#19773](#) [<http://bugs.mysql.com/19773>])
 - On Windows, terminating `mysqld` with Control-C could result in a crash during shutdown. ([Bug#18235](#) [<http://bugs.mysql.com/18235>])
 - Renaming a database to itself caused a server crash. ([Bug#19392](#) [<http://bugs.mysql.com/19392>])
 - For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. ([Bug#10166](#) [<http://bugs.mysql.com/10166>])
 - Using tables from MySQL 4.x in MySQL 5.x, in particular those with `VARCHAR` fields and using `INSERT DELAYED` to update data in the table would result in either data corruption or a server crash. ([Bug#16611](#) [<http://bugs.mysql.com/16611>], [Bug#16218](#) [<http://bugs.mysql.com/16218>], [Bug#17294](#) [<http://bugs.mysql.com/17294>])
 - Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. ([Bug#14400](#) [<http://bugs.mysql.com/14400>])
 - Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. ([Bug#19835](#) [<http://bugs.mysql.com/19835>])
 - Checking a `MyISAM` table (using `CHECK TABLE`) having a spatial index and only one row would wrongly indicate that the table was corrupted. ([Bug#17877](#) [<http://bugs.mysql.com/17877>])
 - A Table ... doesn't exist error could occur for statements that called a function defined in another database. ([Bug#17199](#) [<http://bugs.mysql.com/17199>])
 - `SHOW GRANTS FOR CURRENT_USER` did not return definer grants when executed in `DEFINER` context (such as within a stored procedure defined with `SQL SECURITY DEFINER`), it returned the invoker grants. ([Bug#15298](#) [<http://bugs.mysql.com/15298>])
 - Portions of statements related to partitioning were not surrounded by version-specific comments by `mysqldump`, breaking backwards compatibility for dump files. ([Bug#19488](#) [<http://bugs.mysql.com/19488>])
 - A `DELETE FROM table` with no `WHERE` clause (deleting all rows) running concurrently with `INSERT` statements on a storage engine with row-level locking (such as `NDB`) could produce inconsistent results when using statement-based replication. ([Bug#19066](#) [<http://bugs.mysql.com/19066>])
 - Concatenating the results of multiple constant subselects produced incorrect results. ([Bug#16716](#) [<http://bugs.mysql.com/16716>])
 - The use of `MIN()` and `MAX()` on columns with a partial index produced incorrect results in some queries. ([Bug#18206](#) [<http://bugs.mysql.com/18206>])
 - The `WITH CHECK OPTION` was not enforced when a `REPLACE` statement was executed against a view. ([Bug#19789](#) [<http://bugs.mysql.com/19789>])
 - For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus

losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) ([Bug#16458](http://bugs.mysql.com/16458) [<http://bugs.mysql.com/16458>])

- A buffer overwrite error in Instance Manager caused a crash. ([Bug#20622](http://bugs.mysql.com/20622) [<http://bugs.mysql.com/20622>])
- Re-execution of a prepared multiple-table `DELETE` statement that involves a trigger or stored function can result in a server crash. ([Bug#19634](http://bugs.mysql.com/19634) [<http://bugs.mysql.com/19634>])
- On Windows, corrected a crash stemming from differences in Visual C runtime library routines from POSIX behavior regarding invalid file descriptors. ([Bug#18275](http://bugs.mysql.com/18275) [<http://bugs.mysql.com/18275>])
- Creation of a view as a join of views or tables could fail if the views or tables are in different databases. ([Bug#20482](http://bugs.mysql.com/20482) [<http://bugs.mysql.com/20482>])
- Use of `MIN()` or `MAX()` with `GROUP BY` on a `ucs2` column could cause a server crash. ([Bug#20076](http://bugs.mysql.com/20076) [<http://bugs.mysql.com/20076>])
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. ([Bug#9676](http://bugs.mysql.com/9676) [<http://bugs.mysql.com/9676>])
- Queries on tables that were partitioned by `KEY` and had a `VARCHAR` column as the partitioning key produced an empty result set. ([Bug#20086](http://bugs.mysql.com/20086) [<http://bugs.mysql.com/20086>])
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. ([Bug#16377](http://bugs.mysql.com/16377) [<http://bugs.mysql.com/16377>])
- An invalid comparison between keys in partial indexes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by a partial index over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. ([Bug#14896](http://bugs.mysql.com/14896) [<http://bugs.mysql.com/14896>])
- A prepared statement that altered partitioned table within a stored procedure failed with the error Unknown prepared statement handler. ([Bug#17138](http://bugs.mysql.com/17138) [<http://bugs.mysql.com/17138>])
- A query selecting records from a single partition of a partitioned table and using `ORDER BY ic DESC` (where `ic` represents an indexed column) could cause errors or crash the server. ([Bug#20583](http://bugs.mysql.com/20583) [<http://bugs.mysql.com/20583>])
- `NDB Cluster` (Disk Data): On some platforms, `ndbd` compiled with `gcc 4` would crash when attempting to run `CREATE LOGFILE GROUP`. ([Bug#21981](http://bugs.mysql.com/21981) [<http://bugs.mysql.com/21981>])
- `NDB Cluster`: Setting `TransactionDeadlockDetectionTimeout` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. ([Bug#21800](http://bugs.mysql.com/21800) [<http://bugs.mysql.com/21800>])
- `NDB Cluster`: Data was stored unevenly between partitions due to all `BLOB` data being placed in partition 0. ([Bug#21690](http://bugs.mysql.com/21690) [<http://bugs.mysql.com/21690>])
- `NDB Cluster`: The server provided a non-descriptive error message when encountering a fatally corrupted REDO log. ([Bug#21615](http://bugs.mysql.com/21615) [<http://bugs.mysql.com/21615>])
- `NDB Cluster`: A partial rollback could lead to node restart failures. ([Bug#21536](http://bugs.mysql.com/21536) [<http://bugs.mysql.com/21536>])
- `NDB Cluster`: The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. ([Bug#21384](http://bugs.mysql.com/21384) [<http://bugs.mysql.com/21384>])

- **NDB Cluster**: In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in its nodegroup to shut down. ([Bug#21213](http://bugs.mysql.com/21213) [<http://bugs.mysql.com/21213>])
- **NDB Cluster**: When the redo buffer ran out of space, a Pointer too large error was raised and the cluster could become unusable until restarted with `--initial`. ([Bug#20892](http://bugs.mysql.com/20892) [<http://bugs.mysql.com/20892>])
- **NDB Cluster**: In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message GCP STOP detected. ([Bug#20904](http://bugs.mysql.com/20904) [<http://bugs.mysql.com/20904>])
- **NDB Cluster**: A vague error message was returned when reading of both schema files occurred during a restart of the cluster. ([Bug#20860](http://bugs.mysql.com/20860) [<http://bugs.mysql.com/20860>])
- **NDB Cluster**: The server did not honor the value set for `ndb_cache_check_time` in the `my.cnf` file. ([Bug#20708](http://bugs.mysql.com/20708) [<http://bugs.mysql.com/20708>])
- **NDB Cluster**: The server failed with a non-descriptive error message when out of data memory. ([Bug#18475](http://bugs.mysql.com/18475) [<http://bugs.mysql.com/18475>])
- **NDB Cluster** (Direct APIs): Invoking the MGM API function `ndb_mgm_listen_event()` caused a memory leak. ([Bug#21671](http://bugs.mysql.com/21671) [<http://bugs.mysql.com/21671>])
- **NDB Cluster**: The management client `ALL STATUS` command could sometimes report the status of some data nodes incorrectly. ([Bug#13985](http://bugs.mysql.com/13985) [<http://bugs.mysql.com/13985>])
- **NDB Cluster** (Disk Data): Trying to create a Disk Data table using a nonexistent tablespace or trying to drop a nonexistent datafile from a tablespace produced an uninformative error message. ([Bug#21751](http://bugs.mysql.com/21751) [<http://bugs.mysql.com/21751>])
- **NDB Cluster** (Disk Data): Errors could occur when dropping a datafile during a node local checkpoint. ([Bug#21710](http://bugs.mysql.com/21710) [<http://bugs.mysql.com/21710>])
- **NDB Cluster** (Disk Data): Creating a tablespace and logfile group, then attempting to restart the cluster without using the `--initial` option and without having created any Disk Data tables could cause a forced shutdown of the cluster and raise a configuration error. ([Bug#21172](http://bugs.mysql.com/21172) [<http://bugs.mysql.com/21172>])
- **NDB Cluster**: Responses to the `ALL DUMP 1000` management client command were printed multiple times in the cluster log for each cluster node. ([Bug#21044](http://bugs.mysql.com/21044) [<http://bugs.mysql.com/21044>])
- A memory leak was found when running `ndb_mgm -e "SHOW"`. ([Bug#21670](http://bugs.mysql.com/21670) [<http://bugs.mysql.com/21670>])
- **NDB Cluster** (Direct APIs): The MGM API function `ndb_logevent_get_fd()` was not actually implemented. ([Bug#21129](http://bugs.mysql.com/21129) [<http://bugs.mysql.com/21129>])
- **NDB Cluster**: Restarting a data node while DDL operations were in progress on the cluster could cause other data nodes to fail. This could also lead to `mysqld` hanging or crashing under some circumstances. ([Bug#21017](http://bugs.mysql.com/21017) [<http://bugs.mysql.com/21017>], [Bug#21050](http://bugs.mysql.com/21050) [<http://bugs.mysql.com/21050>])
- **NDB Cluster**: A cluster data node could crash when an ordered index became full before the table containing the index was full. ([Bug#14935](http://bugs.mysql.com/14935) [<http://bugs.mysql.com/14935>])
- **NDB Cluster**: The repeated creating and dropping of a table would eventually lead to **NDB Error 826, Too many tables and attributes ... Insufficient space.** ([Bug#20847](http://bugs.mysql.com/20847) [<http://bugs.mysql.com/20847>])

- **NDB Cluster:** `REPLACE` statements did not work correctly on an `NDB` table having both a primary key and a unique key. In such cases, proper values were not set for columns which were not explicitly referenced in the statement. (Bug#20728 [http://bugs.mysql.com/20728])
- **NDB Cluster:** Trying to create or drop a table while a node was restarting caused the node to crash. This is now handled by raising an error. (Bug#18781 [http://bugs.mysql.com/18781])
- **NDB Cluster:** A race condition could in some circumstances following a `DROP TABLE`. (Bug#20897 [http://bugs.mysql.com/20897])
- **NDB Cluster:** Running `ndbd --nowait-nodes=id` where `id` was the node ID of a node that was already running would fail with an invalid error message. (Bug#20419 [http://bugs.mysql.com/20419])
- **NDB Cluster:** When stopping and restarting multiple data nodes, the last node to be restarted would sometimes hang in Phase 100. (Bug#19645 [http://bugs.mysql.com/19645])
- **NDB Cluster:** The `DATA_LENGTH` and `AVG_ROW_LENGTH` columns of the `INFORMATION_SCHEMA.TABLES` table did not report the size of variable-width column values correctly. (Bug#18413 [http://bugs.mysql.com/18413])

See Section 22.2, “The `INFORMATION_SCHEMA TABLES` Table”, for more information.

- **NDB Cluster:** When attempting to restart the cluster following a data import, the cluster would fail during Phase 4 of the restart with Error 2334: Job buffer congestion. (Bug#20774 [http://bugs.mysql.com/20774])
- **NDB Cluster:** A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. (Bug#20197 [http://bugs.mysql.com/20197])
- **NDB Cluster:** It was possible to use port numbers greater than 65535 for `ServerPort` in the `config.ini` file. (Bug#19164 [http://bugs.mysql.com/19164])
- **NDB Cluster (Replication):** In some cases, a large number of MySQL servers sending requests to the cluster simultaneously could cause the cluster to crash. This could also be triggered by many `NDB` API clients making simultaneous event subscriptions or unsubscriptions. (Bug#20683 [http://bugs.mysql.com/20683])
- **NDB Cluster (Direct APIs):** `NdbScanOperation::readTuples()` and `NdbIndex-ScanOperation::readTuples()` ignored the `batch` parameter. (Bug#20252 [http://bugs.mysql.com/20252])
- **NDB Cluster:** Cluster system status variables were not updated. (Bug#11459 [http://bugs.mysql.com/11459])
- **NDB Cluster (Disk Data):** Trying to create Disk Data tables when running the cluster in diskless mode would crash the cluster's data nodes. (Bug#20008 [http://bugs.mysql.com/20008])

Note: Disk Data tables are now disabled when running in diskless mode.

- **NDB Cluster (Disk Data):** A datafile created on one tablespace could be dropped using `ALTER TABLESPACE ... DROP DATAFILE` on a different tablespace. (Bug#20053 [http://bugs.mysql.com/20053])
- **NDB Cluster:** Truncating a table on one `mysqld` caused other `mysqld` processes in the cluster to return ERROR 1412 (HY000): Table definition has changed, please retry transaction on subsequent queries. (Bug#20705 [http://bugs.mysql.com/20705])
- **NDB Cluster:** The cluster's data nodes would fail while trying to load data when `NoOfFrang-`

`mentLogFiles` was equal to 1. ([Bug#19894](http://bugs.mysql.com/19894) [<http://bugs.mysql.com/19894>])

- **NDB Cluster:** A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()`. A warning is now returned in such cases. ([Bug#19202](http://bugs.mysql.com/19202) [<http://bugs.mysql.com/19202>])
 - **NDB Cluster:** Restarting a failed node could crash the cluster. ([Bug#18782](http://bugs.mysql.com/18782) [<http://bugs.mysql.com/18782>])
 - **NDB Cluster (Disk Data):** The failure of a `CREATE TABLESPACE` or `CREATE LOGFILE GROUP` statement did not revert all changes made prior to the point of failure. ([Bug#16341](http://bugs.mysql.com/16341) [<http://bugs.mysql.com/16341>])
 - **NDB Cluster:** Creating tables with variable-size columns caused `DataMemory` to be used but not freed when the tables were dropped. ([Bug#20007](http://bugs.mysql.com/20007) [<http://bugs.mysql.com/20007>])
 - **NDB Cluster:** Restoring a backup made using `ndb_restore` failed when the backup had been taken from a cluster whose data memory was full. ([Bug#19852](http://bugs.mysql.com/19852) [<http://bugs.mysql.com/19852>])
 - **NDB Cluster:** An excessive number of `ALTER TABLE` operations could cause the cluster to fail with NDB error code 773 (Out of string memory, please modify StringMemory). ([Bug#19275](http://bugs.mysql.com/19275) [<http://bugs.mysql.com/19275>])
 - **NDB Cluster:** `TEXT` columns in Cluster tables having both an explicit primary key and a unique key were not correctly updated by `REPLACE` statements. ([Bug#19906](http://bugs.mysql.com/19906) [<http://bugs.mysql.com/19906>])
 - **NDB Cluster:** Running out of `DataMemory` could sometimes crash `ndbd` and `mysqld` processes. ([Bug#19185](http://bugs.mysql.com/19185) [<http://bugs.mysql.com/19185>])
 - **NDB Cluster (Replication):** A node failure could send duplicate events, causing a `mysqld` replicating tables containing `BLOBs` to crash.
 - **NDB Cluster (Disk Data):** `INFORMATION_SCHEMA.FILES` records for `UNDO` files showed incorrect values in the `EXTENT_SIZE`, `FREE_EXTENTS`, and `TOTAL_EXTENTS` columns. ([Bug#20073](http://bugs.mysql.com/20073) [<http://bugs.mysql.com/20073>])
 - **NDB Cluster:** An internal formatting error caused some management client error messages to be unreadable. ([Bug#20016](http://bugs.mysql.com/20016) [<http://bugs.mysql.com/20016>])
 - **NDB Cluster:** Running management client commands while `mgmd` was in the process of disconnecting could cause the management server to fail. ([Bug#19932](http://bugs.mysql.com/19932) [<http://bugs.mysql.com/19932>])
 - **NDB Cluster (NDBAPI):** Update operations on blobs were not checked for illegal operations.
- Note:** Read locks with blob update operations are now upgraded from read committed to read shared.
- **NDB Cluster:** The management client `ALL STOP` command shut down `mgmd` processes (as well as `ndbd` processes). ([Bug#18966](http://bugs.mysql.com/18966) [<http://bugs.mysql.com/18966>])
 - **NDB Cluster:** Renaming of table columns was not supported as fast a `ALTER TABLE` for NDB tables. ([Bug#20456](http://bugs.mysql.com/20456) [<http://bugs.mysql.com/20456>])
 - **NDB Cluster:** Under some circumstances, repeated DDL operations on one `mysqld` could cause failure of a second `mysqld` attached to the same cluster. ([Bug#19770](http://bugs.mysql.com/19770) [<http://bugs.mysql.com/19770>])
 - **NDB Cluster (Replication):** One or more of the `mysqld` processes could fail when subjecting a

Cluster replication setup with multiple `mysqld` processes on both the master and slave clusters to high loads. (Bug#19768 [<http://bugs.mysql.com/19768>])

- **NDB Cluster:** `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. (Bug#19496 [<http://bugs.mysql.com/19496>])
- **NDB Cluster:** Repeated `CREATE - INSERT - DROP` operations tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. (Bug#18595 [<http://bugs.mysql.com/18595>])
- **NDB Cluster (Disk Data):** Running a large number of scans on Disk Data could cause subsequent scans to perform poorly. (Bug#20334 [<http://bugs.mysql.com/20334>])
- **NDB Cluster (Disk Data):** An issue with disk allocation could sometimes cause a forced shut-down of the cluster when running a mix of memory and Disk Data tables. (Bug#18780 [<http://bugs.mysql.com/18780>])
- **NDB Cluster:** The `mgm` client command `ALL CLUSTERLOG STATISTICS=15;` had no effect. (Bug#20336 [<http://bugs.mysql.com/20336>])
- **NDB Cluster:** Under certain conditions, a starting node could miss transactions, leading to inconsistencies between the primary and backup replicas. (Bug#19929 [<http://bugs.mysql.com/19929>])
- **NDB Cluster:** An uncommitted row could sometimes be checkpointed and thus incorrectly included in a backup. (Bug#19928 [<http://bugs.mysql.com/19928>])
- **NDB Cluster:** A `DELETE` of many rows immediately followed by an `INSERT` on the same table could cause the `ndbd` process on the backup replica to crash. (Bug#19293 [<http://bugs.mysql.com/19293>])
- **NDB Cluster:** `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. (Bug#18864 [<http://bugs.mysql.com/18864>])
- **NDB Cluster:** `SELECT ... FOR UPDATE` failed to lock the selected rows. (Bug#18184 [<http://bugs.mysql.com/18184>])
- **NDB Cluster:** New `mysqld` processes were allowed to connect without a restart of the cluster, causing the cluster to crash. (Bug#13266 [<http://bugs.mysql.com/13266>])
- **NDB Cluster:** The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. (Bug#20185 [<http://bugs.mysql.com/20185>])
- **NDB Cluster:** Renaming a table in such a way as to move it to a different database failed to move the table's indexes. (Bug#19967 [<http://bugs.mysql.com/19967>])
- **NDB Cluster:** `SHOW ENGINE NDB STATUS` could sometimes return an incorrect value of 0 for the latest epoch, which could cause problems with synchronising the binlog. (Bug#20142 [<http://bugs.mysql.com/20142>])
- **NDB Cluster:** A `CREATE TABLE` statement involving foreign key constraints raised an error rather than being silently ignored (see Section 13.1.7, “`CREATE TABLE Syntax`”). (Bug#18483 [<http://bugs.mysql.com/18483>])

This bug affected Cluster in MySQL 5.1 only.

- **NDB Cluster (Replication):** Data definition and data manipulation statements on different tables were not serialised correctly in the binlog. For example, there was no guarantee that a `CREATE TABLE` statement and an update on a different table would occur in the same order in the binlog as

they did on the cluster being replicated. ([Bug#18947](http://bugs.mysql.com/18947) [<http://bugs.mysql.com/18947>])

- **NDB Cluster**: Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `Unique-HashIndexes` could be created. ([Bug#19623](http://bugs.mysql.com/19623) [<http://bugs.mysql.com/19623>])
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc` 4.0. ([Bug#19694](http://bugs.mysql.com/19694) [<http://bugs.mysql.com/19694>])
- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. ([Bug#4981](http://bugs.mysql.com/4981) [<http://bugs.mysql.com/4981>])
- `mysql_upgrade` was missing from binary MySQL distributions. ([Bug#18516](http://bugs.mysql.com/18516) [<http://bugs.mysql.com/18516>], [Bug#20403](http://bugs.mysql.com/20403) [<http://bugs.mysql.com/20403>], [Bug#20556](http://bugs.mysql.com/20556) [<http://bugs.mysql.com/20556>])
- It was possible using `ALTER EVENT ... RENAME ...` to move an event to a database on which the user did not have the `EVENT` privilege. ([Bug#18897](http://bugs.mysql.com/18897) [<http://bugs.mysql.com/18897>])
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. ([Bug#20078](http://bugs.mysql.com/20078) [<http://bugs.mysql.com/20078>])
- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE ... DISABLE KEYS` statement returned Got error 124 from storage engine until `ALTER TABLE ... ENABLE KEYS` was run on the table. ([Bug#20357](http://bugs.mysql.com/20357) [<http://bugs.mysql.com/20357>])
- A redundant table map event could be generated in the binary log when there were no actual changes to a table being replicated. In addition, a slave failed to stop when attempting to replicate a table that did not exist on the slave. ([Bug#18948](http://bugs.mysql.com/18948) [<http://bugs.mysql.com/18948>])
- Multiple calls to a stored procedure that altered a partitioned `MyISAM` table would cause the server to crash. ([Bug#19309](http://bugs.mysql.com/19309) [<http://bugs.mysql.com/19309>])
- Adding an index to a partitioned table that had been created using `AUTO_INCREMENT = value` caused the `AUTO_INCREMENT` value to be reset. ([Bug#19281](http://bugs.mysql.com/19281) [<http://bugs.mysql.com/19281>])
- A `CREATE TABLE` that produced a The PARTITION function returns the wrong type error also caused an Incorrect information in file to be printed to `STDERR`, and a junk file to be left in the database directory. ([Bug#16000](http://bugs.mysql.com/16000) [<http://bugs.mysql.com/16000>])
- Nested natural joins worked executed correctly when executed as a non-prepared statement could fail with an `Unknown column 'col_name' in 'field list'` error when executed as a prepared statement, due to a name resolution problem. ([Bug#15355](http://bugs.mysql.com/15355) [<http://bugs.mysql.com/15355>])
- The `max_length` metadata value for columns created from `CONCAT()` could be incorrect when the collation of an argument differed from the collation of the `CONCAT()` itself. In some contexts such as `UNION`, this could lead to truncation of the column contents. ([Bug#15962](http://bugs.mysql.com/15962) [<http://bugs.mysql.com/15962>])
- The `MD5()` and `SHA()` functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. ([Bug#15351](http://bugs.mysql.com/15351) [<http://bugs.mysql.com/15351>])
- For `BOOLEAN` mode full-text searches on non-indexed columns, `NULL` rows generated by a `LEFT JOIN` caused incorrect query results. ([Bug#14708](http://bugs.mysql.com/14708) [<http://bugs.mysql.com/14708>])

- If the general log table reached a large enough file size (27GB), `SELECT COUNT (*)` on the table caused a server crash. ([Bug#17589](http://bugs.mysql.com/17589) [http://bugs.mysql.com/17589])
- Identifiers could not contain bytes with a value of 255, though that should be allowed as of the identifier-encoding changes made in MySQL 5.1.6. ([Bug#12982](http://bugs.mysql.com/12982) [http://bugs.mysql.com/12982])
- `BIT` columns in a table could cause joins that use the table to fail. ([Bug#18895](http://bugs.mysql.com/18895) [http://bugs.mysql.com/18895])
- A `UNION` over more than 128 `SELECT` statements that use an aggregate function failed. ([Bug#18175](http://bugs.mysql.com/18175) [http://bugs.mysql.com/18175])
- `InnoDB` unlocked its data directory before committing a transaction, potentially resulting in non-recoverable tables if a server crash occurred before the commit. ([Bug#19727](http://bugs.mysql.com/19727) [http://bugs.mysql.com/19727])
- Multiple-table `DELETE` statements containing a subquery that selected from one of the tables being modified caused a server crash. ([Bug#19225](http://bugs.mysql.com/19225) [http://bugs.mysql.com/19225])
- With settings of `read_buffer_size` \geq 2G and `read_rnd_buffer_size` \geq 2G, `LOAD DATA INFILE` failed with no error message or caused a server crash for files larger than 2GB. ([Bug#12982](http://bugs.mysql.com/12982) [http://bugs.mysql.com/12982])
- `REPLACE` statements caused activation of `UPDATE` triggers, not `DELETE` and `INSERT` triggers. ([Bug#13479](http://bugs.mysql.com/13479) [http://bugs.mysql.com/13479])
- The thread for `INSERT DELAYED` rows was maintaining a separate `AUTO_INCREMENT` counter, resulting in incorrect values being assigned if `DELAYED` and non-`DELAYED` inserts were mixed. ([Bug#20195](http://bugs.mysql.com/20195) [http://bugs.mysql.com/20195])
- `mysqldump` wrote an extra pair of `DROP DATABASE` and `CREATE DATABASE` statements if run with the `--add-drop-database` option and the database contained views. ([Bug#17201](http://bugs.mysql.com/17201) [http://bugs.mysql.com/17201])
- Shutting down a slave in a replication scenario where temporary tables are in use would cause the slave to produce a core dump. ([Bug#19881](http://bugs.mysql.com/19881) [http://bugs.mysql.com/19881])
- When a statement is executed that does not generate any rows, an extra table map event and associated binrows event would be generated and written to the binary log. ([Bug#19995](http://bugs.mysql.com/19995) [http://bugs.mysql.com/19995])
- File size specifications for `InnoDB` data files were case sensitive. ([Bug#19609](http://bugs.mysql.com/19609) [http://bugs.mysql.com/19609])
- Compilation on Windows would fail if row based replication was disabled using `-without-row-based-replication`. ([Bug#16837](http://bugs.mysql.com/16837) [http://bugs.mysql.com/16837])
- `InnoDB` did not increment the `handler_read_prev` counter. ([Bug#19542](http://bugs.mysql.com/19542) [http://bugs.mysql.com/19542])
- In the `INFORMATION_SCHEMA.FILES` table, the `INITIAL_SIZE`, `MAXIMUM_SIZE`, and `AUTOEXTEND_SIZE` columns incorrectly were being stored as `VARCHAR` rather than `BIGINT`. ([Bug#19544](http://bugs.mysql.com/19544) [http://bugs.mysql.com/19544]).
- For `mysqld`, Valgrind revealed problems that were corrected: Possible uninitialized data in a string comparison ([Bug#20783](http://bugs.mysql.com/20783) [http://bugs.mysql.com/20783]); memory corruption in replication slaves when switching databases ([Bug#19022](http://bugs.mysql.com/19022) [http://bugs.mysql.com/19022]); syscall write parameter pointing to uninitialized byte ([Bug#20579](http://bugs.mysql.com/20579) [http://bugs.mysql.com/20579]); uninitialized doublewrite memory in `InnoDB` ([Bug#20791](http://bugs.mysql.com/20791) [http://bugs.mysql.com/20791]).

- For `ndb_mgmd`, Valgrind revealed problems that were corrected: A memory leak ([Bug#19318](http://bugs.mysql.com/19318) [<http://bugs.mysql.com/19318>]); a dependency on an uninitialized variable ([Bug#20333](http://bugs.mysql.com/20333) [<http://bugs.mysql.com/20333>]).
- An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. ([Bug#18036](http://bugs.mysql.com/18036) [<http://bugs.mysql.com/18036>])
- SSL connections using yaSSL on OpenBSD could fail. ([Bug#19191](http://bugs.mysql.com/19191) [<http://bugs.mysql.com/19191>])
- Following a failed attempt to add an index to an `ARCHIVE` table, it was no longer possible to drop the database in which the table had been created. ([Bug#17310](http://bugs.mysql.com/17310) [<http://bugs.mysql.com/17310>])
- Using `ALTER TABLE ... ENGINE = x`, where `x` was not a storage engine supported by the server, would cause `mysqld` to crash. ([Bug#20397](http://bugs.mysql.com/20397) [<http://bugs.mysql.com/20397>])
- Defining a table partitioned by `LIST` with a single `PARTITION ... VALUES IN (NULL)` clause could lead to server crashes, particularly with queries having `WHERE` conditions comparing the partitioning key with a constant. ([Bug#19801](http://bugs.mysql.com/19801) [<http://bugs.mysql.com/19801>] / [Bug#20268](http://bugs.mysql.com/20268) [<http://bugs.mysql.com/20268>])
- Values greater than 2 gigabytes used in the `VALUES LESS THAN` clause of a table partitioned by `RANGE` were treated as negative numbers. ([Bug#16002](http://bugs.mysql.com/16002) [<http://bugs.mysql.com/16002>])
- The `fill_help_tables.sql` file did not load properly if the `ANSI_QUOTES` SQL mode was enabled. ([Bug#20542](http://bugs.mysql.com/20542) [<http://bugs.mysql.com/20542>])
- The `fill_help_tables.sql` file did not contain a `SET NAMES 'utf8'` statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as `big5`. ([Bug#20551](http://bugs.mysql.com/20551) [<http://bugs.mysql.com/20551>])
- The `--default-storage-engine` server option did not work. ([Bug#20168](http://bugs.mysql.com/20168) [<http://bugs.mysql.com/20168>])
- The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `ypbind`, `nscd`, `ldap`, and `NTP` are started first (if these are configured on the machine). ([Bug#18810](http://bugs.mysql.com/18810) [<http://bugs.mysql.com/18810>])
- For a reference to a non-existent index in `FORCE INDEX`, the error message referred to a column, not an index. ([Bug#17873](http://bugs.mysql.com/17873) [<http://bugs.mysql.com/17873>])
- The `ENGINE` clause was displayed in the output of `SHOW CREATE TABLE` for partitioned tables when the SQL mode included `no_table_options`. ([Bug#19695](http://bugs.mysql.com/19695) [<http://bugs.mysql.com/19695>])
- `ALTER TABLE ... COALESCE PARTITION` did not delete the files associated with the partitions that were removed. ([Bug#19305](http://bugs.mysql.com/19305) [<http://bugs.mysql.com/19305>])
- `ALTER TABLE ... REBUILD PARTITION` could cause the server to hang or crash. ([Bug#19122](http://bugs.mysql.com/19122) [<http://bugs.mysql.com/19122>])
- Some yaSSL public function names conflicted with those from OpenSSL, causing conflicts for applications that linked against both OpenSSL and a version of `libmysqlclient` that was built with yaSSL support. The yaSSL public functions now are renamed to avoid this conflict. ([Bug#19575](http://bugs.mysql.com/19575) [<http://bugs.mysql.com/19575>])
- `CHECK TABLE` on a `MyISAM` table briefly cleared its `AUTO_INCREMENT` value, while holding only a read lock. Concurrent inserts to that table could use the wrong `AUTO_INCREMENT` value. `CHECK TABLE` no longer modifies the `AUTO_INCREMENT` value. ([Bug#19604](http://bugs.mysql.com/19604) [<http://bugs.mysql.com/19604>])

- If there is a global read lock, `CREATE DATABASE`, `RENAME DATABASE`, and `DROP DATABASE` could deadlock. ([Bug#19815](http://bugs.mysql.com/19815) [http://bugs.mysql.com/19815])
- `EXPLAIN PARTITIONS` would produce illegible output in the `partitions` column if the length of text to be displayed in that column was too long. This could occur when very many partitions were defined for the table, partitions were given very long names, or due to a combination of the two. ([Bug#19684](http://bugs.mysql.com/19684) [http://bugs.mysql.com/19684])
- Trying to execute a query having a `WHERE` clause using `int_col = "string_value" OR int_col IS NULL` on a partitioned table whose partitioning or subpartitioning function used the integer column `int_col` would crash the server. ([Bug#19055](http://bugs.mysql.com/19055) [http://bugs.mysql.com/19055])
- On Linux, `libmysqlclient` when compiled with yaSSL using the `icc` compiler had a spurious dependency on C++ libraries. ([Bug#20119](http://bugs.mysql.com/20119) [http://bugs.mysql.com/20119])
- In MySQL 5.1.11, the `--with-openssl` and `--with-yassl` options were replaced by `--with-ssl`. But no message was issued if the old options were given. Now `configure` produces a message indicating that the new option should be used and exits. ([Bug#20002](http://bugs.mysql.com/20002) [http://bugs.mysql.com/20002])
- Grant table modifications sometimes did not refresh the in-memory tables if the hostname was `' '` or not specified. ([Bug#16297](http://bugs.mysql.com/16297) [http://bugs.mysql.com/16297])
- Invalid escape sequences in option files caused MySQL programs that read them to abort. ([Bug#15328](http://bugs.mysql.com/15328) [http://bugs.mysql.com/15328])
- Using `ALTER TABLE` on a subpartitioned table caused the server to crash. ([Bug#19067](http://bugs.mysql.com/19067) [http://bugs.mysql.com/19067])
- For a table having `LINEAR HASH` subpartitions, the `LINEAR` keyword did not appear in the `SUBPARTITION_METHOD` column of the `INFORMATION_SCHEMA.PARTITIONS` table. ([Bug#20161](http://bugs.mysql.com/20161) [http://bugs.mysql.com/20161])
- Race conditions on certain platforms could cause the Instance Manager to fail to initialize. ([Bug#19391](http://bugs.mysql.com/19391) [http://bugs.mysql.com/19391])
- `ALTER TABLE` on a table created prior to 5.0.3 would cause table corruption if the `ALTER TABLE` did one of the following:
 - Change the default value of a column.
 - Change the table comment.
 - Change the table password.
 ([Bug#17001](http://bugs.mysql.com/17001) [http://bugs.mysql.com/17001])
- An `ALTER TABLE` operation that does not need to copy data, when executed on a table created prior to MySQL 4.0.25, could result in a server crash for subsequent accesses to the table. ([Bug#19192](http://bugs.mysql.com/19192) [http://bugs.mysql.com/19192])
- The binary log lacked character set information for table name when dropping temporary tables. ([Bug#14157](http://bugs.mysql.com/14157) [http://bugs.mysql.com/14157])
- A `B-TREE` index on a `MEMORY` table erroneously reported duplicate entry error for multiple `NULL` values. ([Bug#12873](http://bugs.mysql.com/12873) [http://bugs.mysql.com/12873])
- Race conditions on certain platforms could cause the Instance Manager to try to restart the same instance multiple times. ([Bug#18023](http://bugs.mysql.com/18023) [http://bugs.mysql.com/18023])

- `OPTIMIZE TABLE` and `REPAIR TABLE` yielded incorrect messages or warnings when used on partitioned tables. (Bug#17455 [<http://bugs.mysql.com/17455>])
- Selecting data from a `MEMORY` table with a `VARCHAR` column and a `HASH` index over it returned only the first row matched. (Bug#18233 [<http://bugs.mysql.com/18233>])
- RPM packages had spurious dependencies on Perl modules and other programs. (Bug#13634 [<http://bugs.mysql.com/13634>])

D.1.2. Changes in release 5.1.11 (26 May 2006)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Functionality added or changed:

- **Incompatible change:** The Event Scheduler can now be in one of three states (on, off, or the new suspended state). In addition, due to the fact that `SET GLOBAL event_scheduler;` now acts in a synchronous rather than asynchronous manner, the Event Scheduler thread can be no longer be activated or deactivated at run time. (Bug#17619 [<http://bugs.mysql.com/17619>])

For more information regarding these changes, see [Section 20.1, “Event Scheduler Overview”](#).

- Previously, to build MySQL from source with SSL support enabled, you would invoke `configure` with either the `--with-openssl` or `--with-yassl` option. Those options both have been replaced by the `--with-ssl` option. By default, `--with-ssl` causes the bundled yaSSL library to be used. To select OpenSSL instead, give the option as `--with-ssl=path`, where `path` is the directory where the OpenSSL header files and libraries are located.
- Added the `--ssl-verify-server-cert` option to MySQL client programs. This option causes the server's Common Name value in its certificate to be verified against the hostname used when connecting to the server, and the connection is rejected if there is a mismatch. Added `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for the `mysql_options()` C API function to enable this verification. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. (Bug#17208 [<http://bugs.mysql.com/17208>])
- Added the `ssl_ca`, `ssl_capath`, `ssl_cert`, `ssl_cipher`, and `ssl_key` system variables, which display the values given via the corresponding command options. See [Section 5.9.7.3, “SSL Command Options”](#). (Bug#19606 [<http://bugs.mysql.com/19606>])
- **NDB Cluster:** The limit of 2048 ordered indexes per cluster has been lifted. There is now no upper limit on the number of ordered indexes (including `AUTO_INCREMENT` columns) that may be used. (Bug#14509 [<http://bugs.mysql.com/14509>])
- Added the `log_queries_not_using_indexes` system variable. (Bug#19616 [<http://bugs.mysql.com/19616>])
- Added the `--angel-pid-file` option to `mysqlmanager` for specifying the file in which the angel process records its process ID when `mysqlmanager` runs in daemon mode. (Bug#14106 [<http://bugs.mysql.com/14106>])
- The `ENABLE KEYS` and `DISABLE KEYS` clauses for the `ALTER TABLE` statement are now sup-

ported for partitioned tables. ([Bug#19502](#) [<http://bugs.mysql.com/19502>])

- It is now possible to use `NEW.var_name` values within triggers as `INOUT` parameters to stored procedures. ([Bug#14635](#) [<http://bugs.mysql.com/14635>])
- The default for the `innodb_thread_concurrency` system variable was changed to 8. ([Bug#15868](#) [<http://bugs.mysql.com/15868>])
- `mysql_explain_log` (a third-party program) is no longer included in MySQL distributions.

Bugs fixed:

- **Security fix:** An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function. ([CVE-2006-2753](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-2753>], [Bug#8378](#) [<http://bugs.mysql.com/8378>])

This vulnerability was discovered and reported by Josh Berkus <josh@postgresql.org> and Tom Lane <tgl@sss.pgh.pa.us> as part of the inter-project security collaboration of the OS-DB consortium. For more information about SQL injection, please see the following text.

Discussion: An SQL-injection security hole has been found in multi-byte encoding processing. An SQL-injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set unaware-escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such `mysql_real_escape_string()`.

However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

Workarounds: If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `--sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql_mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system).

- The patch for [Bug#8303](http://bugs.mysql.com/8303) [http://bugs.mysql.com/8303] broke the fix for [Bug#8378](http://bugs.mysql.com/8378) [http://bugs.mysql.com/8378] and was undone. (In string literals with an escape character (\) followed by a multi-byte character that has a second byte of (\), the literal was not interpreted correctly. The next byte now is escaped, not the entire multi-byte character. This means it a strict reverse of the `mysql_real_escape_string()` function.)
- The client libraries had not been compiled for position-independent code on Solaris-SPARC and AMD x86_64 platforms. ([Bug#13159](http://bugs.mysql.com/13159) [http://bugs.mysql.com/13159], [Bug#14202](http://bugs.mysql.com/14202) [http://bugs.mysql.com/14202], [Bug#18091](http://bugs.mysql.com/18091) [http://bugs.mysql.com/18091])
- Altering a `VARCHAR` column in a `MyISAM` table to make it longer could cause corruption of the following column. ([Bug#19386](http://bugs.mysql.com/19386) [http://bugs.mysql.com/19386])
- A `CREATE TABLE` statement that created a table from a materialized view did not inherit default values from the underlying table. ([Bug#19089](http://bugs.mysql.com/19089) [http://bugs.mysql.com/19089])
- **NDB Cluster:** A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of non-default character sets or collations. ([Bug#14918](http://bugs.mysql.com/14918) [http://bugs.mysql.com/14918])
- **NDB Cluster:** `mysqld` processes did not always detect cluster shutdown, leading to issues with Cluster replication and schema distribution. ([Bug#19395](http://bugs.mysql.com/19395) [http://bugs.mysql.com/19395])
- **NDB Cluster:** `SELECT MIN(unique_column)` from a Cluster table with user-defined partitioning crashed the server. ([Bug#18730](http://bugs.mysql.com/18730) [http://bugs.mysql.com/18730])
- Premature optimization of nested subqueries in the `FROM` clause that refer to aggregate functions could lead to incorrect results. ([Bug#19077](http://bugs.mysql.com/19077) [http://bugs.mysql.com/19077])
- For dates with 4-digit year parts less than 200, an implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) Now these operations return `NULL` rather than an incorrect non-`NULL` value. ([Bug#18997](http://bugs.mysql.com/18997) [http://bugs.mysql.com/18997])
- `BLOB` or `TEXT` arguments to or values returned from stored functions were not copied properly if too long and could become garbled. ([Bug#18587](http://bugs.mysql.com/18587) [http://bugs.mysql.com/18587])
- Simultaneous scheduled events whose actions conflicted with one another could crash the server. ([Bug#16428](http://bugs.mysql.com/16428) [http://bugs.mysql.com/16428])
- It was not possible to invoke a stored routine containing dynamic SQL from a scheduled event. ([Bug#19264](http://bugs.mysql.com/19264) [http://bugs.mysql.com/19264])
- **NDB Cluster:** Running `ALL START` in the `NDB` management client or restarting multiple nodes simultaneously could under some circumstances cause the cluster to crash. ([Bug#19930](http://bugs.mysql.com/19930) [http://bugs.mysql.com/19930])
- The result from `CONV()` is a string, but was not always treated the same way as a string when converted to a real value for an arithmetic operation. ([Bug#13975](http://bugs.mysql.com/13975) [http://bugs.mysql.com/13975])
- `CREATE TABLE ... SELECT ...` statements that used a stored function explicitly or implicitly (through a view) resulted in a `Table not locked` error. ([Bug#12472](http://bugs.mysql.com/12472) [http://bugs.mysql.com/12472], [Bug#15137](http://bugs.mysql.com/15137) [http://bugs.mysql.com/15137])
- Within a trigger, `SET` used the SQL mode of the invoking statement, not the mode in effect at trigger creation time. ([Bug#6951](http://bugs.mysql.com/6951) [http://bugs.mysql.com/6951])
- The server no longer uses a signal handler for signal 0 because it could cause a crash on some plat-

forms. ([Bug#15869](http://bugs.mysql.com/15869) [<http://bugs.mysql.com/15869>])

- The embedded server crashed with row-based replication enabled. ([Bug#18518](http://bugs.mysql.com/18518) [<http://bugs.mysql.com/18518>])
- Display better error message for `ALTER TABLE` operations that will result in duplicate keys due to `AUTO_INCREMENT` resequencing. ([Bug#14573](http://bugs.mysql.com/14573) [<http://bugs.mysql.com/14573>])
- The `Data_free` column in the output of `SHOW TABLE STATUS` always displayed 0 for partitioned tables. ([Bug#19501](http://bugs.mysql.com/19501) [<http://bugs.mysql.com/19501>])
- Adding an index to a table created using partitioning by `KEY` and the `MEMORY` storage engine caused the server to crash. ([Bug#19140](http://bugs.mysql.com/19140) [<http://bugs.mysql.com/19140>])
- When creating a table using `CREATE TABLE ... PARTITION BY ... SELECT ...`, the partitioning clause was ignored. ([Bug#19062](http://bugs.mysql.com/19062) [<http://bugs.mysql.com/19062>])
- `ALTER TABLE ENGINE=...` failed when used to change a MySQL Cluster table having no explicit primary key to use a different storage engine. ([Bug#19010](http://bugs.mysql.com/19010) [<http://bugs.mysql.com/19010>])

Note: As a consequence of this fix, `SHOW CREATE TABLE` no longer displays auto-partitioning information for `NDBCluster` tables.

- `NDB Cluster` (NDBAPI): On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. ([Bug#19537](http://bugs.mysql.com/19537) [<http://bugs.mysql.com/19537>])
- `NDB Cluster`: Using “stale” `mysqld .FRM` files could cause a newly-restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. ([Bug#16875](http://bugs.mysql.com/16875) [<http://bugs.mysql.com/16875>])
- `NDB Cluster` (Replication): Memory was not freed after some `ALTER TABLE` operations, which could cause `mysqld` processes to crash. ([Bug#19885](http://bugs.mysql.com/19885) [<http://bugs.mysql.com/19885>])
- `NDB Cluster` (NDBAPI): The `Ndb::dropEventOperation()` method failed to clean up all objects used, which could cause memory leaks to occur. ([Bug#17610](http://bugs.mysql.com/17610) [<http://bugs.mysql.com/17610>])
- `NDB Cluster`: Data node failures could cause excessive CPU usage by `ndb_mgmd`. ([Bug#13987](http://bugs.mysql.com/13987) [<http://bugs.mysql.com/13987>])
- `NDB Cluster`: `TRUNCATE` failed on tables having `BLOB` or `TEXT` columns with the error Lock wait timeout exceeded. This affected both in-memory and Disk Data tables. ([Bug#19201](http://bugs.mysql.com/19201) [<http://bugs.mysql.com/19201>])
- Revised memory allocation for local objects within stored functions and triggers to avoid memory leak for repeated function or trigger invocation. ([Bug#17260](http://bugs.mysql.com/17260) [<http://bugs.mysql.com/17260>])
- `EXPLAIN ... SELECT INTO` caused the client to hang. ([Bug#15463](http://bugs.mysql.com/15463) [<http://bugs.mysql.com/15463>])
- Symlinking `.mysql_history` to `/dev/null` to suppress statement history saving by `mysql` did not work. (`mysql` deleted the symlink and recreated `.mysql_history` as a regular file, and then wrote history to it.) ([Bug#16803](http://bugs.mysql.com/16803) [<http://bugs.mysql.com/16803>])
- The `basedir` and `tmpdir` system variables could not be accessed via `@@var_name` syntax. ([Bug#1039](http://bugs.mysql.com/1039) [<http://bugs.mysql.com/1039>])
- Corrected several problems with the treatment of the `--log-error` option by `mysqld_safe`. These problems were manifest as differences from `mysqld` in error log handling.

- If a filename was given for `--log-error`, `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
- `mysql_safe` now adds `.err` to the end of the filename if no extension is present (the same as `mysqld`).
- `mysqld_safe` treated a relative pathname as relative to its own current working directory. Now it treats a relative pathname as relative to the data directory (the same as `mysqld`).

In addition, some argument quoting problems were corrected. ([Bug#6061](http://bugs.mysql.com/6061) [<http://bugs.mysql.com/6061>])

- Returning the value of a system variable from a stored function caused a server crash. ([Bug#18037](http://bugs.mysql.com/18037) [<http://bugs.mysql.com/18037>])
- Use of uninitialized user variables in a subquery in the `FROM` clause resulted in bad entries in the binary log. ([Bug#19136](http://bugs.mysql.com/19136) [<http://bugs.mysql.com/19136>])
- `IS_USED_LOCK()` could return an incorrect connection identifier. ([Bug#16501](http://bugs.mysql.com/16501) [<http://bugs.mysql.com/16501>])
- Concurrent reading and writing of privilege structures could crash the server. ([Bug#16372](http://bugs.mysql.com/16372) [<http://bugs.mysql.com/16372>])

D.1.3. Changes in release 5.1.10 (Not released)

Note: This was an internal release only, and no binaries were published.

MySQL 5.1.10 includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting these to us.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Functionality added or changed:

- **Security enhancement:** Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` system variable. ([Bug#16365](http://bugs.mysql.com/16365) [<http://bugs.mysql.com/16365>])
- The `mysql_upgrade` command has been converted from a shell script to a C program, so it is available on non-Unix systems such as Windows. This program should be run for each MySQL upgrade. See [Section 5.6.2, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).
- Binary distributions that include SSL support now are built using yaSSL when possible.
- The `MySQL-shared-compat-5.1.X-.i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.0. This avoids a conflict because the 5.0 and 5.1 libraries share the same soname number. It contains libraries for 3.23, 4.0, 4.1, and 5.1. ([Bug#19288](http://bugs.mysql.com/19288) [<http://bugs.mysql.com/19288>])

- The `ONLY_FULL_GROUP_BY` SQL mode now also applies to the `HAVING` clause. That is, columns not named in the `GROUP BY` clause cannot be used in the `HAVING` clause if not used in an aggregate function. ([Bug#18739](http://bugs.mysql.com/18739) [<http://bugs.mysql.com/18739>])
- SQL syntax for prepared statements now supports `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`. ([Bug#19308](http://bugs.mysql.com/19308) [<http://bugs.mysql.com/19308>])
- XPath expressions passed to the `ExtractValue()` and `UpdateXML()` functions can now include the colon character (“ : ”). This enables use of these functions with XML which employs namespaces. ([Bug#18170](http://bugs.mysql.com/18170) [<http://bugs.mysql.com/18170>])
- The bundled yaSSL library was upgraded to version 1.3.5. This improves handling of certain problems with SSL-related command options. ([Bug#17737](http://bugs.mysql.com/17737) [<http://bugs.mysql.com/17737>])
- For the `mysql` client, typing Control-C causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. Previously, Control-C caused `mysql` to exit in all cases. ([Bug#1989](http://bugs.mysql.com/1989) [<http://bugs.mysql.com/1989>])
- Creating a table in an InnoDB database with a column name that matched the name of an internal InnoDB column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns error 1005 (cannot create table) with `errno` set to -1. ([Bug#18934](http://bugs.mysql.com/18934) [<http://bugs.mysql.com/18934>])
- On Windows, some names such as `nul`, `prn`, and `aux` could not be used as filenames because they are reserved as device names. These are now allowable names in MySQL. They are encoded by appending `@@@` to the name when the server creates the corresponding file or directory. This occurs on all platforms for portability of the corresponding database object between platforms. ([Bug#17870](http://bugs.mysql.com/17870) [<http://bugs.mysql.com/17870>])
- Added the `REFERENTIAL_CONSTRAINTS` table to `INFORMATION_SCHEMA`. It provides information about foreign keys.
- Added `--debug` option to Instance Manager.
- Added the `have_dynamic_loading` system variable that indicates whether the server supports dynamic loading of plugins.
- Added the `sql_big_selects` system variable to the output of `SHOW VARIABLES`.
- You must now have the `DROP` privilege to drop table partitions. ([Bug#17139](http://bugs.mysql.com/17139) [<http://bugs.mysql.com/17139>])
- **NDB Cluster:** It is now possible to perform a partial start of a cluster. That is, it is now possible to bring up the cluster without running `ndbd --initial` on all configured data nodes first. ([Bug#18606](http://bugs.mysql.com/18606) [<http://bugs.mysql.com/18606>])
- **NDB Cluster:** It is now possible to restore a Cluster backup between big-endian and little-endian machines. ([Bug#19255](http://bugs.mysql.com/19255) [<http://bugs.mysql.com/19255>])
- **NDB Cluster:** It is now possible to install MySQL with Cluster support to a non-default location and change the search path for font description files using either the `--basedir` or `-character-sets-dir` options. (Previously in MySQL 5.1, `ndbd` searched only the default path for character sets.)
- In result set metadata, the `MYSQL_FIELD.length` value for `BIT` columns now is reported in number of bits. For example, the value for a `BIT(9)` column is 9. (Formerly, the value was related to number of bytes.) ([Bug#13601](http://bugs.mysql.com/13601) [<http://bugs.mysql.com/13601>])
- Added the `KEY_BLOCK_SIZE` table option and index option. This can be used in `CREATE`

, `ALTER TABLE`, and `CREATE INDEX` statements to provide a hint to the storage engine about the size to use for index key blocks. The engine is allowed to change the value if necessary.

Bugs fixed:

- **Security fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (CVE-2006-1516 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1516>], CVE-2006-1517 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1517>]) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug.
- **Security fix:** A malicious client, using specially crafted invalid `COM_TABLE_DUMP` packets was able to trigger an exploitable buffer overflow on the server. (CVE-2006-1518 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1518>]) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug.
- **NDB Cluster (Replication):** Using the `--binlog-do-db` option caused problems with `CREATE TABLE` on the cluster acting as the replication master. (Bug#19492 [<http://bugs.mysql.com/19492>])
- **NDB Cluster:** Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug # 17421)
- **NDB Cluster:** Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug#18591 [<http://bugs.mysql.com/18591>])
- **NDB Cluster:** An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. (Bug#17150 [<http://bugs.mysql.com/17150>])
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. (Bug#12633 [<http://bugs.mysql.com/12633>])
- A view definition that referred to an alias in the `HAVING` clause could be saved in the `.frm` file with the alias replaced by the expression that it referred to, causing failure of subsequent `SELECT * FROM view_name` statements. (Bug#19573 [<http://bugs.mysql.com/19573>])
- A compatibility issue with NPTL (Native POSIX Thread Library) on Linux could result in a deadlock with `FLUSH TABLES WITH READ LOCK` under some conditions. (Bug#20048 [<http://bugs.mysql.com/20048>])
- **MyISAM** table deadlock was possible if one thread issued a `LOCK TABLES` request for write locks and then an administrative statement such as `OPTIMIZE TABLE`, if between the two statements another client meanwhile issued a multiple-table `SELECT` for some of the locked tables. (Bug#16986 [<http://bugs.mysql.com/16986>])
- The patch for Bug#17164 [<http://bugs.mysql.com/17164>] introduced the problem that some outer joins were incorrectly converted to inner joins. (Bug#19816 [<http://bugs.mysql.com/19816>])
- A `NUL` byte within a comment in a statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (CVE-2006-0903 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-0903>]) (Bug#17667 [<http://bugs.mysql.com/17667>])
- **NDB Cluster:** `mysqld` could crash when attempting an update if the cluster had failed previously. (Bug#18798 [<http://bugs.mysql.com/18798>])

- `mysql-test-run.pl` started NDB even for test cases that didn't need it. (Bug#19083 [<http://bugs.mysql.com/19083>])
- Selecting from a view that used `GROUP BY` on a non-constant temporal interval (such as `DATE(col) + INTERVAL TIME_TO_SEC(col) SECOND`) could cause a server crash. (Bug#19490 [<http://bugs.mysql.com/19490>])
- An outer join of two views that was written using `{ OJ ... }` syntax could cause a server crash. (Bug#19396 [<http://bugs.mysql.com/19396>])
- `mysql` displayed `NULL` for strings that are empty or contain only spaces. (Bug#19564 [<http://bugs.mysql.com/19564>])
- A range access optimizer heuristic was invalid, causing some queries to be much slower in MySQL 5.0 than in 4.0. (Bug#17379 [<http://bugs.mysql.com/17379>], Bug#18940 [<http://bugs.mysql.com/18940>])
- `SELECT DISTINCT` queries sometimes returned only the last row. (Bug#18068 [<http://bugs.mysql.com/18068>])
- Eliminated some memory corruption problems that resulted in `double free or corruption` errors and a server crash. (Bug#19154 [<http://bugs.mysql.com/19154>])
- Use of `CONVERT_TZ()` in a stored function or trigger (or in a stored procedure called from a stored function or trigger) caused an error. (Bug#11081 [<http://bugs.mysql.com/11081>])
- Some queries were slower in 5.0 than in 4.1 because some 4.1 cost-evaluation code had not been merged into 5.0. (Bug#14292 [<http://bugs.mysql.com/14292>])
- `MySQL-shared-compat-5.1.9-0.i386.rpm` incorrectly depended on `glibc` 2.3 and could not be installed on a `glibc` 2.2 system. (Bug#16539 [<http://bugs.mysql.com/16539>])
- Updates to a `MEMORY` table caused the size of `BTREE` indexes for the table to increase. (Bug#18160 [<http://bugs.mysql.com/18160>])
- `REPAIR TABLE` did not restore the length for packed keys in tables created under MySQL 4.x. (Bug#17810 [<http://bugs.mysql.com/17810>])
- The parser leaked memory when its stack needed to be extended. (Bug#18930 [<http://bugs.mysql.com/18930>])
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug#10405 [<http://bugs.mysql.com/10405>])
- Use of `--default-storage-engine=innodb` resulted in an error with the server reporting that `InnoDB` was an unknown table type. (Bug#16691 [<http://bugs.mysql.com/16691>])
- Executing a `CREATE EVENT` statement could cause 100% CPU usage. (Bug#19170 [<http://bugs.mysql.com/19170>])
- After calling `FLUSH STATUS`, the `max_used_connections` variable did not increment for existing connections and connections which use the thread cache. (Bug#15933 [<http://bugs.mysql.com/15933>])
- MySQL would not compile on Linux distributions that use the `tinfn` library. (Bug#18912 [<http://bugs.mysql.com/18912>])
- An issue with file handling in the partitioning code could cause `mysqld` to crash when started and then stopped within a very short period of time. (Bug#19313 [<http://bugs.mysql.com/19313>])

- **NDB Cluster** (Replication): When taking part in Cluster replication of tables containing `BLOB` columns, `mysqld` falsely reported a large memory leak in the replication buffers when there was none. ([Bug#19247](http://bugs.mysql.com/19247) [<http://bugs.mysql.com/19247>])
- **NDB Cluster**: Stopping multiple nodes could cause node failure handling not to be completed. ([Bug#19039](http://bugs.mysql.com/19039) [<http://bugs.mysql.com/19039>])
- **NDB Cluster**: A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. ([Bug#18597](http://bugs.mysql.com/18597) [<http://bugs.mysql.com/18597>])
- **NDB Cluster**: `ndbd` could sometimes fail to start with the error Node failure handling not completed following a graceful restart. ([Bug#18550](http://bugs.mysql.com/18550) [<http://bugs.mysql.com/18550>])
- **NDB Cluster**: Backups could fail for large clusters with many tables, where the number of tables approached `MaxNoOfTables`. ([Bug#17607](http://bugs.mysql.com/17607) [<http://bugs.mysql.com/17607>])
- **NDB Cluster**: A 5.1.6 or newer server did not read local checkpoints recorded by any other 5.1 version, thus preventing a system restart following an upgrade. ([Bug#19333](http://bugs.mysql.com/19333) [<http://bugs.mysql.com/19333>])
- **NDB Cluster**: Trying to restore the `apply_status` table from a 5.0 cluster backup failed on a 5.1 server. ([Bug#18935](http://bugs.mysql.com/18935) [<http://bugs.mysql.com/18935>])
- **NDB Cluster** (Disk Data): `CREATE LOGFILE GROUP` accepted values other than `NDB` or `NDBCLUSTER` in the `ENGINE` clause. ([Bug#18604](http://bugs.mysql.com/18604) [<http://bugs.mysql.com/18604>])
- **NDB Cluster** (Disk Data): Omitting the required `ENGINE` clause from a `CREATE LOGFILE GROUP` or `CREATE TABLESPACE` statement caused the server to crash. An appropriate error message is now returned instead. ([Bug#18603](http://bugs.mysql.com/18603) [<http://bugs.mysql.com/18603>])
- **NDB Cluster**: `mysqldump` included in its output data from the internal `cluster` database. ([Bug#17840](http://bugs.mysql.com/17840) [<http://bugs.mysql.com/17840>])
- Event-creation statements enclosed in multi-line comments using `/*!version_number ... */` syntax were not parsed correctly. ([Bug#18078](http://bugs.mysql.com/18078) [<http://bugs.mysql.com/18078>])
- Within a trigger, `CONNECTION_ID()` did not return the connection ID of the thread that caused the trigger to be activated. ([Bug#16461](http://bugs.mysql.com/16461) [<http://bugs.mysql.com/16461>])
- `mysqltest` incorrectly interpreted some `ER_xxx` error names given in the `error` command. ([Bug#18495](http://bugs.mysql.com/18495) [<http://bugs.mysql.com/18495>])
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. ([Bug#18767](http://bugs.mysql.com/18767) [<http://bugs.mysql.com/18767>])
- Logging to the `mysql.general_log` and `mysql.slow_log` tables did not work for Windows builds because the `CSV` storage engine was unavailable. The `CSV` engine now is enabled in Windows builds. ([Bug#17368](http://bugs.mysql.com/17368) [<http://bugs.mysql.com/17368>])
- `LOAD DATA FROM MASTER` would fail when trying to load the `INFORMATION_SCHEMA` database from the master, because the `INFORMATION_SCHEMA` system database would already exist on the slave. ([Bug#18607](http://bugs.mysql.com/18607) [<http://bugs.mysql.com/18607>])
- The binary log would create an incorrect `DROP` query when creating temporary tables during replication. ([Bug#17263](http://bugs.mysql.com/17263) [<http://bugs.mysql.com/17263>])
- `CREATE VIEW` statements would not be replicated to the slave if the `-replicate-wild-ignore-table` rule was enabled. ([Bug#18715](http://bugs.mysql.com/18715))

[<http://bugs.mysql.com/18715>])

- In `mysqltest`, `--sleep=0` had no effect. Now it correctly causes `sleep` commands in test case files to sleep for 0 seconds. (Bug#18312 [<http://bugs.mysql.com/18312>])
- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. (Bug#19145 [<http://bugs.mysql.com/19145>])
- Index corruption could occur in cases when `key_cache_block_size` was not a multiple of `myisam_block_size` (for example, with `key_cache_block_size=1536` and `myisam_block_size=1024`). (Bug#19079 [<http://bugs.mysql.com/19079>])
- The `sql_big_selects` system variable was not displayed by `SHOW VARIABLES`. (Bug#17849 [<http://bugs.mysql.com/17849>])
- The `sql_notes` and `sql_warnings` system variables were not always displayed correctly by `SHOW VARIABLES` (for example, they were displayed as `ON` after being set to `OFF`). (Bug#16195 [<http://bugs.mysql.com/16195>])
- `LAST_INSERT_ID()` in a stored function or trigger returned zero. (Bug#15728 [<http://bugs.mysql.com/15728>])
- Use of `CONVERT_TZ()` in a view definition could result in spurious syntax or access errors. (Bug#15153 [<http://bugs.mysql.com/15153>])
- The `system_time_zone` and `version_*` system variables could not be accessed via `SELECT @@var_name` syntax. (Bug#12792 [<http://bugs.mysql.com/12792>], Bug#15684 [<http://bugs.mysql.com/15684>])
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. (Bug#18691 [<http://bugs.mysql.com/18691>])
- Some fast `ALTER TABLE` operations (requiring no temporary table) did not work for all tables. (Bug#19011 [<http://bugs.mysql.com/19011>])
- `DELETE` and `UPDATE` statements that used large `NOT IN (value_list)` clauses could use large amounts of memory. (Bug#15872 [<http://bugs.mysql.com/15872>])
- Prevent recursive views caused by using `RENAME TABLE` on a view after creating it. (Bug#14308 [<http://bugs.mysql.com/14308>])
- A `LOCK TABLES` statement that failed could cause `MyISAM` not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. (Bug#18544 [<http://bugs.mysql.com/18544>])
- A failed `ALTER TABLE` operation could fail to clean up a temporary `.frm` file. (Bug#18129 [<http://bugs.mysql.com/18129>])
- For a reference to a non-existent stored function in a stored routine that had a `CONTINUE` handler, the server continued as though a useful result had been returned, possibly resulting in a server crash. (Bug#18787 [<http://bugs.mysql.com/18787>])
- `InnoDB` did not use a consistent read for `CREATE ... SELECT` when `innodb_locks_unsafe_for_binlog` was set. (Bug#18350 [<http://bugs.mysql.com/18350>])
- `InnoDB` could read a delete mark from its system tables incorrectly. (Bug#19217 [<http://bugs.mysql.com/19217>])
- `myisamchk` and `myisam_ftdump` should allow either table names or `.MYI` filenames as argu-

- ments, but allowed only table names. ([Bug#19220](http://bugs.mysql.com/19220) [<http://bugs.mysql.com/19220>])
- `DROP DATABASE` did not drop stored routines associated with the database if the database name was longer than 21 characters. ([Bug#18344](http://bugs.mysql.com/18344) [<http://bugs.mysql.com/18344>])
 - Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. ([Bug#13621](http://bugs.mysql.com/13621) [<http://bugs.mysql.com/13621>])
 - Executing `SELECT` on a large table that had been compressed within `myisampack` could cause a crash. ([Bug#17917](http://bugs.mysql.com/17917) [<http://bugs.mysql.com/17917>])
 - `NDB Cluster` (NDBAPI): Passing a nonexistent index name to `NdbIndexScanOperation::setBound()` caused a segmentation fault. ([Bug#19088](http://bugs.mysql.com/19088) [<http://bugs.mysql.com/19088>])
 - `ALTER TABLE ... REBUILD PARTITION` returned an inaccurate error message. ([Bug#16819](http://bugs.mysql.com/16819) [<http://bugs.mysql.com/16819>])
 - `NDB Cluster`: In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. ([Bug#19198](http://bugs.mysql.com/19198) [<http://bugs.mysql.com/19198>])
 - `InnoDB`: A `DELETE` followed by an `INSERT` and then by an `UPDATE` on a partitioned `InnoDB` table caused subsequent queries to return incorrect results. ([Bug#17992](http://bugs.mysql.com/17992) [<http://bugs.mysql.com/17992>])
 - `NDB Cluster`: A table insert or update of more than 128 bytes of data in a 4-replica Cluster could cause a node to crash. ([Bug#18622](http://bugs.mysql.com/18622) [<http://bugs.mysql.com/18622>])
 - `NDB Cluster` (Disk Data): Concurrent table schema operations and operations on logfiles groups, tablespaces, datafiles, or undofiles could lead to Cluster node failures. ([Bug#18575](http://bugs.mysql.com/18575) [<http://bugs.mysql.com/18575>])
 - `NDB Cluster`: An issue with replication caused a `mysqld` connected to a replicated cluster to crash when entering single user mode. ([Bug#18535](http://bugs.mysql.com/18535) [<http://bugs.mysql.com/18535>])
 - Successive `ALTER TABLE ... DROP PARTITION` statements on the same subpartitioned table could eventually cause the server to crash. ([Bug#18962](http://bugs.mysql.com/18962) [<http://bugs.mysql.com/18962>])
 - `NDB Cluster`: When attempting to create an index on a `BIT` or `BLOB` column, Error 743: Unsupported character set in table or index was returned instead of Error 906: Unsupported attribute type in index.
 - `NDB Cluster`: The Cluster binlog `mysqld` accepted updates even though the binary log was not set up, which could lead to updates missing from the binary log. ([Bug#18932](http://bugs.mysql.com/18932) [<http://bugs.mysql.com/18932>])
 - `NDB Cluster`: Concurrent `INSERT` and `ROLLBACK` statements from different connections could cause node failures. ([Bug#19245](http://bugs.mysql.com/19245) [<http://bugs.mysql.com/19245>])
 - `NDB Cluster` (Disk Data): Running an `INSERT` and a `DELETE` on a Disk Data table in the same transaction could cause a deadlock. ([Bug#19244](http://bugs.mysql.com/19244) [<http://bugs.mysql.com/19244>])
 - `NDB Cluster` (Disk Data): Issuing a `CREATE LOGFILE GROUP` statement during the drop of an `NDB` table would cause database corruption. ([Bug#19141](http://bugs.mysql.com/19141) [<http://bugs.mysql.com/19141>])
 - `NDB Cluster`: `ndb_restore` failed to restore a backup made from a 5.0 cluster to a 5.1 cluster. ([Bug#18210](http://bugs.mysql.com/18210) [<http://bugs.mysql.com/18210>])
 - `NDB Cluster`: Adding an index to an unsigned integer column did not work correctly. ([Bug#18133](http://bugs.mysql.com/18133) [<http://bugs.mysql.com/18133>])

- **NDB Cluster**: A `SELECT` from an NDB table with `ORDER BY indexed_column` and a `LIMIT` clause would fail following `ALTER TABLE`. (Bug#18094 [http://bugs.mysql.com/18094])
- **NDB Cluster**: Performing multiple `ALTER TABLE` operations on the same NDB table from different `mysqld` processes in the same cluster led to schema versioning errors when trying to access the table again following the restart of one of the `mysqld` processes. (Bug#16445 [http://bugs.mysql.com/16445])
- **NDB Cluster**: Starting `mysqld` without `--log-bin` caused DDL statements on NDB tables to time out. (Bug#19214 [http://bugs.mysql.com/19214])
- **NDB Cluster**: Fragment IDs were not being logged correctly, causing `ndb_restore_log` to fail. (Bug#18594 [http://bugs.mysql.com/18594])
- Casting a string to `DECIMAL` worked, but casting a trimmed string (using `LTRIM()` or `RTRIM()`) resulted in loss of decimal digits. (Bug#17043 [http://bugs.mysql.com/17043])
- **NDB Cluster (Replication)**: Delete and update of rows in a table without a primary key failed on the slave. (Bug#17400 [http://bugs.mysql.com/17400])
- **NDB Cluster**: On slow networks or CPUs, the management client `SHOW` command could sometimes erroneously show all data nodes as being master nodes belonging to nodegroup 0. (Bug#15530 [http://bugs.mysql.com/15530])
- The XPath `string-length()` function was not implemented for use with `ExtractValue()`. (Bug#16319 [http://bugs.mysql.com/16319])
- Fix the way that Instance Manager finds the version number of instances, so that it works properly when the executable name isn't the same as what the Instance Manager launched (such as when wrapping a `libtool`-wrapped executable from the source tree). (Bug#19059 [http://bugs.mysql.com/19059])
- The server attempted to flush uninitialized log tables during `SIGHUP` processing, causing a crash. (Bug#18848 [http://bugs.mysql.com/18848])
- If the second or third argument to `BETWEEN` was a constant expression such as `'2005-09-01 - INTERVAL 6 MONTH` and the other two arguments were columns, `BETWEEN` was evaluated incorrectly. (Bug#18618 [http://bugs.mysql.com/18618])
- If the first argument to `BETWEEN` was a `DATE` or `TIME` column of a view and the other arguments were constants, `BETWEEN` did not perform conversion of the constants to the appropriate temporary type, resulting in incorrect evaluation. (Bug#16069 [http://bugs.mysql.com/16069])
- `ExtractValue` function did not return character data within `<![CDATA[]>` as expected. (Bug#18285 [http://bugs.mysql.com/18285])
- Server and clients ignored the `--sysconfdir` option that was passed to `configure`. (Bug#15069 [http://bugs.mysql.com/15069])
- It was possible to create a `RANGE`-partitioned table with a partition defined using the clause `VALUES LESS THAN (NULL)`, even though such a partition could never contain any values whatsoever. (Bug#18752 [http://bugs.mysql.com/18752])
- Running an `ALTER TABLE` on a partitioned table simultaneously experiencing a high number of concurrent DML statements could crash the server. (Bug#18572 [http://bugs.mysql.com/18572])
- It was possible to use trailing spaces in the names of partitions and subpartitions. Attempting to do so now raises the error Incorrect partition name. (Bug#17973 [http://bugs.mysql.com/17973])

- `LIKE` searches failed on a `CHAR` column used as the partitioning column of a table partitioned by `KEY`. (Bug#17946 [<http://bugs.mysql.com/17946>])
- If the `WHERE` condition of a query contained an `OR`-ed `FALSE` term, the set of tables whose rows cannot serve for null-complements in outer joins was determined incorrectly. This resulted in blocking possible conversions of outer joins into joins by the optimizer for such queries. (Bug#17164 [<http://bugs.mysql.com/17164>])
- The `ExtractValue()` function failed with a syntax error when the XPath expression used special characters such as Ñ (“N-tilde”). (Bug#16233 [<http://bugs.mysql.com/16233>])
- Inserts failed with duplicate key errors on a table partitioned using an `AUTO_INCREMENT` column for the partitioning key. (Bug#18552 [<http://bugs.mysql.com/18552>], Bug#18753 [<http://bugs.mysql.com/18753>])
- Delimited identifiers for partitions were not being treated the same as delimited identifiers for other database objects (such as tables and columns) with regard to allowed characters. (Bug#18750 [<http://bugs.mysql.com/18750>])
- A query on a table partitioned or subpartitioned by `HASH` did not display all results when using a `WHERE` condition involving a column used in the hashing expression. (Bug#18423 [<http://bugs.mysql.com/18423>], Bug#18329 [<http://bugs.mysql.com/18329>])
- If the server were built without partition support, it was possible to run partitioning-related statements with no errors or warnings, even though these statements would have no effect. Now such statements are disallowed unless the server has been compiled using the `--with-partition` option. (Bug#15561 [<http://bugs.mysql.com/15561>])
- **NDB Cluster:** In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` could cause the cluster to come up partitioned (“split-brain” issue). (Bug#16447 [<http://bugs.mysql.com/16447>])

A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. (Bug#18612 [<http://bugs.mysql.com/18612>])
- **NDB Cluster:** On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. (Bug#15695 [<http://bugs.mysql.com/15695>])
- **NDB Cluster:** Unused open handlers for tables in which the metadata had changed were not properly closed. This could result in stale results from Cluster tables following an `ALTER TABLE`. (Bug#13228 [<http://bugs.mysql.com/13228>])
- **NDB Cluster:** Uninitialized internal variables could lead to unexpected results. (Bug#11033 [<http://bugs.mysql.com/11033>], Bug#11034 [<http://bugs.mysql.com/11034>])
- The presence of multiple equalities in a condition after reading a constant table could cause the optimizer not to use an index. This resulted in certain queries being much slower than in MySQL 4.1. (Bug#16504 [<http://bugs.mysql.com/16504>])
- A recent change caused the `mysql` client not to display `NULL` values correctly and to display numeric columns left-justified rather than right-justified. The problems have been corrected. (Bug#18265 [<http://bugs.mysql.com/18265>])
- **InnoDB** failure to release an adaptive hash index latch could cause a server crash if the query cache was enabled. (Bug#15758 [<http://bugs.mysql.com/15758>])
- **InnoDB:** `ALTER TABLE` to add or drop a foreign key for an **InnoDB** table had no effect.

[Bug#18477](http://bugs.mysql.com/18477) [<http://bugs.mysql.com/18477>])

- **NDB Cluster**: Attempting to create an index using multiple columns on an explicitly partitioned table in a replicated Cluster database could cause the master `mysqld` process to crash. ([Bug#18284](http://bugs.mysql.com/18284) [<http://bugs.mysql.com/18284>])
- **NDB Cluster**: Queries using `ORDER BY pkN` failed against a `LIST`-partitioned Cluster table having a multi-column primary key, where `pkN` represents one of the columns making up the primary key. ([Bug#18598](http://bugs.mysql.com/18598) [<http://bugs.mysql.com/18598>])
- Updating a field value when also requesting a lock with `GET_LOCK()` would cause slave servers in a replication environment to terminate. ([Bug#17284](http://bugs.mysql.com/17284) [<http://bugs.mysql.com/17284>])

D.1.4. Changes in release 5.1.9 (12 April 2006)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production*-level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Functionality added or changed:

- `SHOW PLUGIN` was renamed to `SHOW PLUGINS`. `SHOW PLUGIN` now is deprecated and generates a warning. ([Bug#17112](http://bugs.mysql.com/17112) [<http://bugs.mysql.com/17112>])
- Binary MySQL distributions now include a `mysqld-max` server, in addition to the usual `mysqld` optimized server and the `mysqld-debug` debugging server.
- `mysqld_safe` no longer checks for a `mysqld-max` binary. Instead, `mysqld_safe` now checks only for the standard `mysqld` server unless another server binary is specified explicitly via `-mysqld` or `--mysqld-version`. If you previously relied on the implicit invocation of `mysqld-max`, you should use an appropriate option now. ([Bug#17861](http://bugs.mysql.com/17861) [<http://bugs.mysql.com/17861>])
- For partitioned tables, the output of `SHOW TABLE STATUS` now shows in the `Engine` column the name of the storage engine used by all partitions for the table; in the `Create_options` column, the output now shows `partitioned` for a partitioned table. This change also affects the values shown in the corresponding columns of the `INFORMATION_SCHEMA.TABLES` table. ([Bug#17631](http://bugs.mysql.com/17631) [<http://bugs.mysql.com/17631>])
- **NDB Cluster**: A new `--nowait-nodes` startup option for `ndbd` makes it possible to “skip” specific nodes without waiting for them to start when starting the cluster. See [Section 15.6.5.2, “Command Options for ndbd”](#).
- The `NDBCluster` storage engine now supports `CREATE TABLE` statements of arbitrary length. (Previously, `CREATE TABLE` statements for MySQL Cluster tables could contain a maximum of 4096 characters only.) ([Bug#17813](http://bugs.mysql.com/17813) [<http://bugs.mysql.com/17813>])

- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. ([Bug#13571](http://bugs.mysql.com/13571) [<http://bugs.mysql.com/13571>])

Bugs fixed:

- **Security fix:** Invalid arguments to `DATE_FORMAT()` caused a server crash. ([CVE-2006-3469](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-3469) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-3469>], [Bug#20729](http://bugs.mysql.com/20729) [<http://bugs.mysql.com/20729>]) Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it.
- **NDB Cluster:** `BLOB` columns did not work correctly with user-partitioned `NDB` tables. ([Bug#16796](http://bugs.mysql.com/16796) [<http://bugs.mysql.com/16796>])
- `mysql_config` returned incorrect libraries on `x86_64` systems. ([Bug#13158](http://bugs.mysql.com/13158) [<http://bugs.mysql.com/13158>])
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. ([Bug#18830](http://bugs.mysql.com/18830) [<http://bugs.mysql.com/18830>])
- `COUNT(*)` on a `MyISAM` table could return different results for the base table and a view on the base table. ([Bug#18237](http://bugs.mysql.com/18237) [<http://bugs.mysql.com/18237>])
- For `mysql.server`, if the `basedir` option was specified after `datadir` in an option file, the setting for `datadir` was ignored and assumed to be located under `basedir`. ([Bug#16240](http://bugs.mysql.com/16240) [<http://bugs.mysql.com/16240>])
- For full-text searches in boolean mode, and when a full-text parser plugin was used, a `MYSQL_FTPARSER_PARAM::ftparser_state` could have been corrupted by recursive calls to the plugin. ([Bug#18836](http://bugs.mysql.com/18836) [<http://bugs.mysql.com/18836>])
- `EXTRACT(QUARTER FROM date)` returned unexpected results. ([Bug#18100](http://bugs.mysql.com/18100) [<http://bugs.mysql.com/18100>])
- `TRUNCATE` did not reset the `AUTO_INCREMENT` counter for `MyISAM` tables when issued inside a stored procedure. ([Bug#14945](http://bugs.mysql.com/14945) [<http://bugs.mysql.com/14945>])
Note: This bug did not affect `InnoDB` tables. Also, `TRUNCATE` does not reset the `AUTO_INCREMENT` counter for `NDBCluster` tables regardless of when it is called (see [Bug#18864](http://bugs.mysql.com/18864) [<http://bugs.mysql.com/18864>]).
- The server was always built as though `--with-extra-charsets=complex` had been specified. ([Bug#12076](http://bugs.mysql.com/12076) [<http://bugs.mysql.com/12076>])
- Partition pruning did not work properly for some kinds of partitioning and subpartitioning, with certain `WHERE` clauses. (Partitions and subpartitions that should have been marked as used were not so marked.) The error could manifest as incorrect content in `EXPLAIN PARTITIONS` output as well as missing rows in the results of affected queries. ([Bug#18558](http://bugs.mysql.com/18558) [<http://bugs.mysql.com/18558>])
- **NDB Cluster:** An uninitialized internal variable could lead to unexpected results. ([Bug#18831](http://bugs.mysql.com/18831) [<http://bugs.mysql.com/18831>])
- For tables created in a MySQL 4.1 installation upgraded to MySQL 5.0 and up, multiple-table updates could update only the first matching row. ([Bug#16281](http://bugs.mysql.com/16281) [<http://bugs.mysql.com/16281>])
- Complex queries with nested joins could cause a server crash. ([Bug#18279](http://bugs.mysql.com/18279) [<http://bugs.mysql.com/18279>])

- A query against a partitioned table using `WHERE col IS NULL` could produce incorrect results given the following conditions:
 - The table had partitions and subpartitions
 - The partitioning function depended on a single column `col` of one of the MySQL integer types
 - The partitioning function was not monotonically increasing

The same issue could cause the server to crash when run in debug mode. ([Bug#18659](http://bugs.mysql.com/18659) [<http://bugs.mysql.com/18659>])

- `CAST(double AS SIGNED INT)` for large `double` values outside the signed integer range truncates the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. ([Bug#15098](http://bugs.mysql.com/15098) [<http://bugs.mysql.com/15098>])
- `MEDIUMINT` columns were not handled in the same way as other column types by partition pruning.

Partition pruning would sometimes use inappropriate columns in performing queries.

Both of these issues were rectified as part of the same bugfix. ([Bug#18025](http://bugs.mysql.com/18025) [<http://bugs.mysql.com/18025>])

- Quoted values could not be used for partition option values. ([Bug#13520](http://bugs.mysql.com/13520) [<http://bugs.mysql.com/13520>])
- Delimited identifiers could not be used in defining partitions. ([Bug#13433](http://bugs.mysql.com/13433) [<http://bugs.mysql.com/13433>])
- Building the server using `--with-example-storage-engine` failed to enable the `EXAMPLE` storage engine in the server. ([Bug#18464](http://bugs.mysql.com/18464) [<http://bugs.mysql.com/18464>])
- Triggers created in one version of the server could not be dropped after upgrading to a newer version. ([Bug#15921](http://bugs.mysql.com/15921) [<http://bugs.mysql.com/15921>])
- Queries using `WHERE ... IS NULL` returned incorrect results from partitioned tables. ([Bug#18070](http://bugs.mysql.com/18070) [<http://bugs.mysql.com/18070>])
- Partition pruning did not perform correctly with partitions on `NULL`, and could potentially crash the server. ([Bug#18053](http://bugs.mysql.com/18053) [<http://bugs.mysql.com/18053>])
- If `InnoDB` encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled back a transaction, the transaction was still written to the binary log. ([Bug#18283](http://bugs.mysql.com/18283) [<http://bugs.mysql.com/18283>])

D.1.5. Changes in release 5.1.8 (Not released)

Note: This was an internal release only, and no binaries were published.

Functionality added or changed:

- In order not to break legacy applications, support for `TYPE = engine_name` has been restored, but now generates a warning.

Important: This option has been deprecated since MySQL 4.0. *Beginning with MySQL 5.2, `TYPE = engine_name` will no longer be available and will produce a syntax error. You should not use `TYPE` in any new applications, and you should immediately begin conversion of existing applications to use the `ENGINE = engine_name` syntax instead.* ([Bug#17501](http://bugs.mysql.com/17501))

[<http://bugs.mysql.com/17501>])

- The deprecated constructs in the following table now generate warnings. You should not employ them in new applications, as they are likely to be removed in a future version of MySQL. Use the equivalents shown in the table's second column instead. For the same reason, existing applications depending on the deprecated constructs should be converted to make use of the current equivalents as soon as possible. ([Bug#17501](#) [<http://bugs.mysql.com/17501>])

Deprec- ated / Ob- solete:	Current / Preferred:
<code>@@table _type</code>	<code>@@stora ge_engi ne</code>
<code>@@log_b in_trus t_routi ne_crea tors</code>	<code>@@log_b in_trus t_funct ion_cre ators</code>

	.
TYPE=	ENGINE=
BACKUP TABLE	mysql-dump, mysql-hotcopy, or MySQL Administrator
RESTORE TABLE, LOAD TABLE FROM MASTER	mysql-dump, mysql, or MySQL Administrator
SHOW TABLE TYPES	SHOW [STORAGE] ENGINES
SHOW INNODB STATUS	SHOW ENGINE INNODB STATUS
SHOW MUTEX STATUS	SHOW ENGINE INNODB MUTEX
SHOW BDB LOGS, SHOW LOGS	SHOW ENGINE BDB LOGS

The deprecated items shown in the table are not guaranteed to be available in MySQL 5.2 or later.

- **Incompatible change:** For purposes of determining placement, `RANGE` partitioning now treats `NULL` as less than any other value. (Formerly, `NULL` was treated as equal to zero.) See [Section 16.2.6, “How MySQL Partitioning Handles NULL Values”](#). (Bug#15447 [<http://bugs.mysql.com/15447>])
- **Incompatible Change:** The semantics of `ALTER TABLE t ENGINE=X`; for partitioned tables is changed, and now means that the storage engine used for table `t` is changed to `X`.

The previous statement formerly (prior to MySQL 5.1.8) meant that all partitioning was removed from the table. In order to remove the partitioning of a table, the syntax `ALTER TABLE t REMOVE PARTITIONING`; is introduced. The `REMOVE PARTITIONING` option can be used in combination with existing `ALTER TABLE` options such as those employed for adding or dropping columns or indexes. (Bug#17754 [<http://bugs.mysql.com/17754>])

- Added the `--sysdate-is-now` option to `mysqld` to enable `SYSDATE()` to be treated as an alias for `NOW()`. See [Section 12.5, “Date and Time Functions”](#). (Bug#15101 [<http://bugs.mysql.com/15101>])

- The `NDBCluster` storage engine now supports `INSERT IGNORE` and `REPLACE` statements. Previously, these statements failed with an error. (Bug#17431 [<http://bugs.mysql.com/17431>])
- Events no longer support times past the end of the Unix epoch. (Formerly, such dates were interpreted as being at the beginning of the Unix epoch.) (Bug#16396 [<http://bugs.mysql.com/16396>])
- Event names are now case-insensitive. That is (for example), you cannot have events with the names `Myevent` and `MyEvent` belonging to the same database and definer. (Bug#16415 [<http://bugs.mysql.com/16415>])
- Builds for Windows, Linux, and Unix (except AIX) platforms now have SSL support enabled, in the server as well as in the client libraries. Because part of the SSL code is written in C++, this does introduce dependencies on the system's C++ runtime libraries in several cases, depending on compiler specifics. (Bug#18195 [<http://bugs.mysql.com/18195>])
- Temporary tables may no longer be partitioned. (Bug#17497 [<http://bugs.mysql.com/17497>])
- Added the `--events` option to `mysqldump` to enable events to be included in the dump output. (Bug#16853 [<http://bugs.mysql.com/16853>])
- `NDB Cluster` (Disk Data): You can now have only one logfile group at any one time. See Section 13.1.8, “`CREATE LOGFILE GROUP Syntax`”. (Bug#16386 [<http://bugs.mysql.com/16386>])
- The syntax for `CREATE PROCEDURE` and `CREATE FUNCTION` statements now includes a `DEFINER` clause. The `DEFINER` value specifies the security context to be used when checking access privileges at routine invocation time if the routine has the `SQL SECURITY DEFINER` characteristic. See Section 18.2.1, “`CREATE PROCEDURE and CREATE FUNCTION Syntax`”, for more information.

When `mysqldump` is invoked with the `--routines` option, it now dumps the `DEFINER` value for stored routines.

- The output from `SHOW CREATE TABLE` is more consistent about using uppercase for keywords. Data types still are in lowercase. (Bug#10460 [<http://bugs.mysql.com/10460>])
- The `ExtractValue()` function with `contains()` now uses the SQL collation in making comparisons. Previously, comparisons were always binary (that is, case-sensitive). (Bug#16316 [<http://bugs.mysql.com/16316>])
- The `cluster_replication` database has been renamed to `cluster`. This will effect replication between MySQL Clusters where one cluster is running MySQL 5.1.8 or later, and the other is running MySQL 5.1.7 or earlier. See Section 15.10, “`MySQL Cluster Replication`”, and especially Section 15.10.4, “`Replication Schema and Tables`”.
- The stability of `CREATE` and `DROP` operations on `NDB` tables containing `BLOB` columns has been improved. (Bug#17761 [<http://bugs.mysql.com/17761>])
- More specific error messages are now given when attempting to create an excessive number of partitions or subpartitions. (Previously, no distinction was made between an excessive number of partitions and an excessive number of subpartitions.) (Bug#17393 [<http://bugs.mysql.com/17393>])
- The `mysqltest` utility now converts all `CR/LF` combinations to `LF` to allow test cases intended for Windows to work properly on UNIX-like systems. (Bug#13809 [<http://bugs.mysql.com/13809>])
- The `mysql_ping` function will now retry if the `reconnect` flag is set and error `CR_SERVER_LOST` is encountered during the first attempt to ping the server. (Bug#14057 [<http://bugs.mysql.com/14057>])
- `mysqldump` now surrounds the `DEFINER`, `SQL SECURITY DEFINER` and `WITH CHECK OP-`

`VIEW` clauses of a `CREATE VIEW` statement with "not in version" comments to prevent errors in earlier versions of MySQL. ([Bug#14871](http://bugs.mysql.com/14871) [<http://bugs.mysql.com/14871>])

- For an event having no `STARTS` time specified when it was created, the `mysql.event` table's `start` column now displays the creation time rather than `NULL`. ([Bug#16537](http://bugs.mysql.com/16537) [<http://bugs.mysql.com/16537>])

In addition, both the `SHOW EVENTS` statement's `Starts` column and the `STARTS` column of the `INFORMATION_SCHEMA.EVENTS` table are now empty rather than `NULL` when `STARTS` was not used in the `CREATE EVENT` statement.

- `MICROSECOND` intervals are no longer allowed for events. ([Bug#16411](http://bugs.mysql.com/16411) [<http://bugs.mysql.com/16411>])
- Description of the `EVENT` privilege has been changed to `To create, alter, drop, and execute events`. ([Bug#16412](http://bugs.mysql.com/16412) [<http://bugs.mysql.com/16412>])
- The `binlog_format` system variable now is dynamic and can be changed at runtime, as described in [Section 6.3, "Row-Based Replication"](#).
- The `binlog_format` system variable now can be set to a third format, `MIXED`, as described in [Section 6.3, "Row-Based Replication"](#).
- A slave server may switch the format *automatically* now. This happens when the server is running in either `STATEMENT` or `MIXED` format and encounters a row in the binary log that is written in `ROW` logging format. In that case, the slave switches to row-based replication temporarily for that event, and switches back to the previous format afterwards.
- Partition pruning was made more stable, particularly in cases involving queries using tests for `NULL` values in the `WHERE` clause against subpartitioned tables which were partitioned by `LIST(some_function(coll, ... ,colN))`. ([Bug#17891](http://bugs.mysql.com/17891) [<http://bugs.mysql.com/17891>])
- Names of subpartitions must now be unique for an entire table, and not merely within the same partition. ([Bug#15408](http://bugs.mysql.com/15408) [<http://bugs.mysql.com/15408>])
- The output of `SHOW CREATE EVENT` no longer qualifies the event name with the name of the schem to which the event belongs. ([Bug#17714](http://bugs.mysql.com/17714) [<http://bugs.mysql.com/17714>])
- The client API will now attempt to reconnect on TCP/IP if the `reconnect` flag is set, as is the case with sockets. ([Bug#2845](http://bugs.mysql.com/2845) [<http://bugs.mysql.com/2845>])
- The XPath `last()` function is now implemented for use with `ExtractValue()`. ([Bug#16318](http://bugs.mysql.com/16318) [<http://bugs.mysql.com/16318>])

Bugs fixed:

- Stored routine names longer than 64 characters were silently truncated. Now the limit is properly enforced and an error occurs. ([Bug#17015](http://bugs.mysql.com/17015) [<http://bugs.mysql.com/17015>])
- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. ([Bug#15375](http://bugs.mysql.com/15375) [<http://bugs.mysql.com/15375>])
- Slave servers would retry the execution of a SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the NDB engine. ([Bug#16228](http://bugs.mysql.com/16228) [<http://bugs.mysql.com/16228>])

- Replication of data stored in a partitioned table would cause slave servers to issue a assertion and terminate. ([Bug#18436](http://bugs.mysql.com/18436) [<http://bugs.mysql.com/18436>])
- The `mysql_close()` C API function leaked handles for shared-memory connections on Windows. ([Bug#15846](http://bugs.mysql.com/15846) [<http://bugs.mysql.com/15846>])
- Checks for permissions on database operations could be performed in a case-insensitive manner (a user with permissions on database `MYDATABASE` could by accident get permissions on database `myDataBase`), if the privilege data were still cached from a previous check. ([Bug#17279](http://bugs.mysql.com/17279) [<http://bugs.mysql.com/17279>])
- The server would crash when `SHOW STATUS` was called on a server linked with `yaSSL`. ([Bug#18310](http://bugs.mysql.com/18310) [<http://bugs.mysql.com/18310>])
- `SELECT ... WHERE column LIKE 'A%'`, when `column` had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. ([Bug#17374](http://bugs.mysql.com/17374) [<http://bugs.mysql.com/17374>])
- Using `ALTER TABLE` to increase the length of a `BINARY(M)` column caused column values to be padded with spaces rather than `0x00` bytes. ([Bug#16857](http://bugs.mysql.com/16857) [<http://bugs.mysql.com/16857>])
- Execution of a stored function or trigger which inserted data into a table while running concurrent selects on the same table could result in storing incorrect data in the query cache. ([Bug#14767](http://bugs.mysql.com/14767) [<http://bugs.mysql.com/14767>])
- **NDB Cluster:** Attempting to restart a node with dropped events still pending would fail. ([Bug#18491](http://bugs.mysql.com/18491) [<http://bugs.mysql.com/18491>])
- **NDB Cluster:** In asynchronous replication scenarios, binary log events could be lost on the remote `mysqld`. (Bug # 18472)
- **NDB Cluster:** Two `mysqld` processes starting at the same time could cause a race condition. ([Bug#18472](http://bugs.mysql.com/18472) [<http://bugs.mysql.com/18472>])
- **NDB Cluster:** Two `mysqld` processes did not synchronise `DROP TABLE` binary log events correctly. ([Bug#18395](http://bugs.mysql.com/18395) [<http://bugs.mysql.com/18395>])
- **NDB Cluster:** When multiple node restarts were attempted without allowing each restart to complete, the error message returned was Array index out of bounds rather than Too many crashed replicas. ([Bug#18349](http://bugs.mysql.com/18349) [<http://bugs.mysql.com/18349>])
- A `SELECT ... ORDER BY ...` from a view defined using a function could crash the server. An example of such a view might be `CREATE VIEW v1 AS SELECT SQRT(c1) FROM t1`. ([Bug#18386](http://bugs.mysql.com/18386) [<http://bugs.mysql.com/18386>])
- `REPAIR TABLE`, `OPTIMIZE TABLE`, and `ALTER TABLE` operations on transactional tables (or on tables of any type on Windows) could corrupt triggers associated with those tables. ([Bug#18153](http://bugs.mysql.com/18153) [<http://bugs.mysql.com/18153>])
- **MyISAM:** Performing a bulk insert on a table referenced by a trigger would crash the table. ([Bug#17764](http://bugs.mysql.com/17764) [<http://bugs.mysql.com/17764>])
- Using `ORDER BY intvar` within a stored procedure (where `intvar` is an integer variable or expression) would crash the server. ([Bug#16474](http://bugs.mysql.com/16474) [<http://bugs.mysql.com/16474>])

Note: The use of an integer `i` in an `ORDER BY i` clause for sorting the result by the `ith` column is deprecated (and non-standard). It should *not* be used in new applications. See [Section 13.2.7, “SELECT Syntax”](#).

- A `SELECT` using a function against a nested view would crash the server. (Bug#15683 [<http://bugs.mysql.com/15683>])
- `ALTER TABLE ... ADD COLUMN ... AFTER ...` failed when used on partitioned tables. (Bug#16806 [<http://bugs.mysql.com/16806>])
- **NDB Cluster**: A timeout in the handling of an `ABORT` condition with more than 32 operations could yield a node failure. (Bug#18414 [<http://bugs.mysql.com/18414>])
- **NDB Cluster**: A node restart immediately following a `CREATE TABLE` would fail. **Important**: This fix supports 2-node Clusters only. (Bug#18385 [<http://bugs.mysql.com/18385>])
- **NDB Cluster**: In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. (Bug#18352 [<http://bugs.mysql.com/18352>])
- **NDB Cluster**: The cluster created a crashed replica of a table having an ordered index — or when logging was not enabled, of a table having a table or unique index — leading to a crash of the cluster following 8 successive restarts. (Bug#18298 [<http://bugs.mysql.com/18298>])
- **NDB Cluster**: When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. (Bug#18118 [<http://bugs.mysql.com/18118>])
- **NDB Cluster**: Restarting nodes were allowed to start and join the cluster too early. (Bug#16772 [<http://bugs.mysql.com/16772>])
- **NDB Cluster**: Issuing a `DROP LOGFILE GROUP` statement would cause `ndbd` processes to crash if MySQL had been compiled with `gcc4`. (Bug#18295 [<http://bugs.mysql.com/18295>])
- Using triggers with partitioned `InnoDB` tables led to incorrect results. (Bug#17744 [<http://bugs.mysql.com/17744>])
- Calling `CREATE TABLE` or `ALTER TABLE` twice on a partitioned table in a stored procedure or a prepared statement resulted in errors and sometimes server crashes. (Bug#17290 [<http://bugs.mysql.com/17290>])
- A problem with `NULLs` and interval mapping sometimes caused incorrect results or crashes when trying to use less-than searches on partitioned tables. (Bug#17173 [<http://bugs.mysql.com/17173>])
- `CREATE TABLE ... PARTITION ... AS SELECT ...` would cause the server to crash. (Bug#15336 [<http://bugs.mysql.com/15336>])
- Creating a partition which depends on an expression containing a column using the UTF8 character set would cause the server to crash. (Bug#14367 [<http://bugs.mysql.com/14367>])
- Invoking more than once a prepared statement that creates a partitioned table would crash the server. (Bug#14350 [<http://bugs.mysql.com/14350>])
- **NDB Cluster**: A `SELECT ... ORDER BY` query on an explicitly partitioned Cluster table with no explicit indexes would crash the server. (Bug#17899 [<http://bugs.mysql.com/17899>])
- The `ExtractValue()` function did not return an error when passed an invalid XPath string. (Bug#18172 [<http://bugs.mysql.com/18172>])
- Stored procedures that call UDFs and pass local string variables caused server crashes. (Bug#17261 [<http://bugs.mysql.com/17261>])
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character

- set crashed the server. ([Bug#18004](http://bugs.mysql.com/18004) [http://bugs.mysql.com/18004])
- Loading of UDFs in a statically linked MySQL caused a server crash. UDF loading is now blocked if the MySQL server is statically linked. ([Bug#11835](http://bugs.mysql.com/11835) [http://bugs.mysql.com/11835])
 - A security enhancement in Visual Studio 8 could cause a MySQL debug server compiled with it to hang when running `SELECT` queries against partitioned tables. ([Bug#17722](http://bugs.mysql.com/17722) [http://bugs.mysql.com/17722])
 - `NDB Cluster: auto_increment` values were not propagated correctly in statement-based replication. ([Bug#18208](http://bugs.mysql.com/18208) [http://bugs.mysql.com/18208])
 - Repeated invocations of a stored procedure containing a `SHOW CREATE EVENT` statement would result in the error Packets out of order. ([Bug#17403](http://bugs.mysql.com/17403) [http://bugs.mysql.com/17403])
 - Repeated invocations of a stored procedure containing a `CREATE EVENT` or `ALTER EVENT` statement would crash the server. ([Bug#16408](http://bugs.mysql.com/16408) [http://bugs.mysql.com/16408])
 - Renaming and adding a new column to a partitioned table in the same `ALTER TABLE` statement caused the server to crash. ([Bug#17772](http://bugs.mysql.com/17772) [http://bugs.mysql.com/17772])
 - `ALTER TABLE ... REBUILD PARTITION` with no partition name specified would crash the server. ([Bug#17940](http://bugs.mysql.com/17940) [http://bugs.mysql.com/17940])
 - Trying to add a partition to a table having subpartitions could crash the server. ([Bug#17140](http://bugs.mysql.com/17140) [http://bugs.mysql.com/17140])
 - Attempting to use a conflicting `VALUES` clause in `ALTER TABLE ... ADD PARTITION` caused the server to crash. An example of such a conflicting clause would be that uses `VALUES LESS THAN (constant)` (which indicates a range) with a table that is partitioned by `LIST`. ([Bug#17127](http://bugs.mysql.com/17127) [http://bugs.mysql.com/17127])
 - `ALTER TABLE ... COALESCE PARTITION` failed with an Out of Memory error. ([Bug#16810](http://bugs.mysql.com/16810) [http://bugs.mysql.com/16810])
 - Names of subpartitions were not displayed in the output of `SHOW CREATE TABLE`. ([Bug#16370](http://bugs.mysql.com/16370) [http://bugs.mysql.com/16370])
 - Setting up subpartitions on at least one but not all the partitions of a partitioned table caused the server to crash. ([Bug#15407](http://bugs.mysql.com/15407) [http://bugs.mysql.com/15407])
 - `InnoDB` used table locks (not row locks) within stored functions. ([Bug#18077](http://bugs.mysql.com/18077) [http://bugs.mysql.com/18077])
 - Using the `position()` function in the XPath argument to `ExtractValue()` crashed the server. ([Bug#18171](http://bugs.mysql.com/18171) [http://bugs.mysql.com/18171])
 - A query with a `WHERE date_column > date_value` condition failed on a table partitioned by `RANGE`. ([Bug#17894](http://bugs.mysql.com/17894) [http://bugs.mysql.com/17894])
 - Cursors in stored routines could cause a server crash. ([Bug#16887](http://bugs.mysql.com/16887) [http://bugs.mysql.com/16887])
 - Replication slaves could not replicate triggers from older servers that included no `DEFINER` clause in the trigger definition. Now the trigger executes with the privileges of the invoker (which on the slave is the slave SQL thread). ([Bug#16266](http://bugs.mysql.com/16266) [http://bugs.mysql.com/16266])
 - Character set conversion of string constants for `UNION` of constant and table column was not done when it was safe to do so. ([Bug#15949](http://bugs.mysql.com/15949) [http://bugs.mysql.com/15949])

- `NULL` values were written to the `mysql.slow_log` table incorrectly. (Bug#17600 [<http://bugs.mysql.com/17600>])
- A query with a `WHERE date_column > date_value` condition failed on a table partitioned by `RANGE`. (Bug#17894 [<http://bugs.mysql.com/17894>])
- A failed `ALTER TABLE ... ADD PRIMARY KEY` on a partitioned table would result in bad table metadata and could possibly crash the server. (Bug#17097 [<http://bugs.mysql.com/17097>])
- No error was reported when subpartitions were defined for a non-subpartitioned table. (Bug#15961 [<http://bugs.mysql.com/15961>])
- Searches on indexed columns of partitioned tables failed to find all matching rows following updates of the indexed columns. (Bug#14526 [<http://bugs.mysql.com/14526>])
- The `DEFINER` value for stored routines was not replicated. (Bug#15963 [<http://bugs.mysql.com/15963>])
- Use of `TRUNCATE TABLE` for a `TEMPORARY` table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` counter properly. (Bug#17137 [<http://bugs.mysql.com/17137>])
- `SELECT COUNT(*)` for a `MyISAM` table could return different results depending on whether an index was used. (Bug#14980 [<http://bugs.mysql.com/14980>])
- Updating a view that filters certain rows to set a filtered out row to be included in the table caused infinite loop. For example, if the view has a `WHERE` clause of `salary > 100` then issuing an `UPDATE` statement of `SET salary = 200 WHERE id = 10`, caused an infinite loop. (Bug#17726 [<http://bugs.mysql.com/17726>])
- Creating a table with the same name as the mapped name of another table caused a server crash. For example, if MySQL maps the table name `txu#P#p1` to `txu@0023P@0023p1` on disk, creating another table named `txu@0023P@0023p1` crashed the server. (Bug#17142 [<http://bugs.mysql.com/17142>])
- `NDB Cluster`: Adding an index together with replication could cause `mysqld` to crash. (Bug#18106 [<http://bugs.mysql.com/18106>])
- `NDB Cluster`: Insufficient stringbuffer memory when attempting to create a trigger caused the server to crash. (Bug#18101 [<http://bugs.mysql.com/18101>])
- `NDB Cluster`: Variable-length columns used as primary keys were not handled correctly. (Bug#18075 [<http://bugs.mysql.com/18075>])
- `NDB Cluster`: Row-based replication could fail with tables using `VARCHAR` columns for primary keys and having `BLOB` columns. (Bug#18067 [<http://bugs.mysql.com/18067>])
- `NDB Cluster`: `CREATE UNIQUE INDEX` on a column containing non-unique data could cause one or more `ndbd` nodes to hang or crash. (Bug#18040 [<http://bugs.mysql.com/18040>])
- `NDB Cluster` (Disk Data): `CREATE UNIQUE INDEX` failed with Error 4243: Index not found. (Bug#18039 [<http://bugs.mysql.com/18039>])
- `NDB Cluster`: Node recovery of tables with `VARCHAR` columns using character sets was inconsistent, which could cause a number of issues, including the data nodes failing to restart and `ALTER TABLE` statements to hang. (Bug#18026 [<http://bugs.mysql.com/18026>])
- `NDB Cluster`: In some cases, a single `ndbd` node would fail following a system restart. (Bug#17854 [<http://bugs.mysql.com/17854>])

- **NDB Cluster** (Replication): The binary log on the secondary master was not being set up correctly following a table rename. ([Bug#17838](http://bugs.mysql.com/17838) [http://bugs.mysql.com/17838])
- **NDB Cluster**: With a single replica, transactions waiting in the log synchronisation queue were not being restarted, causing them to be aborted. ([Bug#17536](http://bugs.mysql.com/17536) [http://bugs.mysql.com/17536])
- **NDB Cluster** (Disk Data): It was not possible to create more than 9 tablespaces. ([Bug#16913](http://bugs.mysql.com/16913) [http://bugs.mysql.com/16913])
- **NDB Cluster**: Inserting and deleting **BLOB** column values while a backup was in process could cause the loss of an **ndbd** node. ([Bug#14028](http://bugs.mysql.com/14028) [http://bugs.mysql.com/14028])
- **NDB Cluster**: **UNDO_BUFFER_SIZE** was limited to 17 MB. ([Bug#16657](http://bugs.mysql.com/16657) [http://bugs.mysql.com/16657], [Bug#17890](http://bugs.mysql.com/17890) [http://bugs.mysql.com/17890])
- Using **ALTER TABLE ... REBUILD PARTITION** without specifying the name of the partition caused the server to crash, rather than reporting a syntax error. ([Bug#17947](http://bugs.mysql.com/17947) [http://bugs.mysql.com/17947])
- When attempting to insert a **0** into a **LIST**-partitioned table that had no value-list containing **0**, no error was reported. ([Bug#15253](http://bugs.mysql.com/15253) [http://bugs.mysql.com/15253])
- If the server was started with the **--skip-grant-tables** option, it was impossible to create a trigger or a view without explicitly specifying a **DEFINER** clause. ([Bug#16777](http://bugs.mysql.com/16777) [http://bugs.mysql.com/16777])
- The server would execute stored routines that had a non-existent definer. ([Bug#13198](http://bugs.mysql.com/13198) [http://bugs.mysql.com/13198])
- **NDB Cluster**: A simultaneous **RENAME** of several tables was logged multiple times. ([Bug#17827](http://bugs.mysql.com/17827) [http://bugs.mysql.com/17827])
- **NDB Cluster**: Trying to perform a **DELETE** from a Cluster table following a **LOCK TABLES** would cause the **ndbd** processes to hang. ([Bug#17812](http://bugs.mysql.com/17812) [http://bugs.mysql.com/17812])
- **ALTER TABLE ... REORGANIZE PARTITION** failed with Error on rename of *filename* ... on Windows. ([Bug#17720](http://bugs.mysql.com/17720) [http://bugs.mysql.com/17720])
- **NDB Cluster**: **ALTER TABLE ... ADD INDEX** failed with ERROR 756: Index on disk column is not supported when run against a Disk Data table having a primary key. ([Bug#17888](http://bugs.mysql.com/17888) [http://bugs.mysql.com/17888])
- **NDB Cluster**: **DELETE** operations on **NDB** tables could cause memory leaks. ([Bug#16874](http://bugs.mysql.com/16874) [http://bugs.mysql.com/16874])
- **NDB Cluster**: Some query cache statistics were not always correctly reported for Cluster tables. ([Bug#16795](http://bugs.mysql.com/16795) [http://bugs.mysql.com/16795])
- The **EXAMPLE** storage engine did not work on Windows. ([Bug#17721](http://bugs.mysql.com/17721) [http://bugs.mysql.com/17721])
- For **FEDERATED** tables, a **SELECT** statement with an **ORDER BY** clause did not return rows in the proper order. ([Bug#17377](http://bugs.mysql.com/17377) [http://bugs.mysql.com/17377])
- Setting the **myisam_repair_threads** system variable to a value larger than 1 could cause corruption of large **MyISAM** tables. ([Bug#11527](http://bugs.mysql.com/11527) [http://bugs.mysql.com/11527])
- The length of a **VARCHAR()** column that used the **utf8** character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the **CREATE**

- `TABLE` statement to fail. ([Bug#13134](http://bugs.mysql.com/13134) [http://bugs.mysql.com/13134])
- The MySQL server could crash with out of memory errors when performing aggregate functions on a `DECIMAL` column. ([Bug#17602](http://bugs.mysql.com/17602) [http://bugs.mysql.com/17602])
- `INSERT` statements executed by scheduled events were not written to the general log. ([Bug#16413](http://bugs.mysql.com/16413) [http://bugs.mysql.com/16413])
- A memory leak caused warnings on slaves for certain statements that executed without warning on the master. ([Bug#16175](http://bugs.mysql.com/16175) [http://bugs.mysql.com/16175])
- Naming a partition using the characters `Ç` or `ç` (“c-cedilla”; Unicode `00C7` or `00E7`) made unreadable the table containing the partition. ([Bug#14527](http://bugs.mysql.com/14527) [http://bugs.mysql.com/14527])
- The `self()` XPath function was not handled correctly by `ExtractValue()`. ([Bug#16315](http://bugs.mysql.com/16315) [http://bugs.mysql.com/16315])
- The `ExtractValue()` function would not accept expressions which matched element names containing an underscore character. ([Bug#16320](http://bugs.mysql.com/16320) [http://bugs.mysql.com/16320])
- NDB Cluster:** Trying to update very large partitioned tables using the `NDB` storage engine sometimes caused the server to crash. ([Bug#16385](http://bugs.mysql.com/16385) [http://bugs.mysql.com/16385], [Bug#17806](http://bugs.mysql.com/17806) [http://bugs.mysql.com/17806])
- Slow queries executed by scheduled events were not being written to the slow query log. ([Bug#16426](http://bugs.mysql.com/16426) [http://bugs.mysql.com/16426])
- On Linux, creation of table partitions failed within a stored procedure. ([Bug#14363](http://bugs.mysql.com/14363) [http://bugs.mysql.com/14363])
- `mysql_fix_privilege_tables` didn't create the `mysql.plugin` table. ([Bug#17568](http://bugs.mysql.com/17568) [http://bugs.mysql.com/17568])
- Improper checking of binary log statements could result in a server crash. ([Bug#17457](http://bugs.mysql.com/17457) [http://bugs.mysql.com/17457])
- The `ExtractValue()` function allowed the use of the `!` character in identifiers by ignoring the illegal character. This is now correctly reported as a syntax error. ([Bug#16313](http://bugs.mysql.com/16313) [http://bugs.mysql.com/16313])
- NDB Cluster:** Trying to insert a value into a nonexistent `LIST` partition of an `NDB` table would cause the server to crash. ([Bug#17763](http://bugs.mysql.com/17763) [http://bugs.mysql.com/17763])
- NDB Cluster:** `ALTER TABLE` on a partitioned `NDB` table could cause the server to crash. ([Bug#17499](http://bugs.mysql.com/17499) [http://bugs.mysql.com/17499])
- NDB Cluster:** A repeated `SELECT` on a partitioned table that used the `NDB` storage engine could cause the server to crash. ([Bug#17390](http://bugs.mysql.com/17390) [http://bugs.mysql.com/17390])
- NDB Cluster:** Using `ALTER TABLE ... ADD PARTITION` on a table partitioned by `LIST` would cause the client to hang. ([Bug#17701](http://bugs.mysql.com/17701) [http://bugs.mysql.com/17701])
- Triggers created without `BEGIN` and `END` clauses resulted in “You have an error in your SQL syntax” errors when dumping and replaying a binary log. ([Bug#16878](http://bugs.mysql.com/16878) [http://bugs.mysql.com/16878])
- The `RENAME TABLE` statement did not move triggers to the new table. ([Bug#13525](http://bugs.mysql.com/13525) [http://bugs.mysql.com/13525])
- Clients compiled from source with the `--without-readline` did not save command history

from session to session. ([Bug#16557](http://bugs.mysql.com/16557) [<http://bugs.mysql.com/16557>])

- Stored routines that contained only a single statement were not written properly to the dumpfile when using `mysqldump`. ([Bug#14857](http://bugs.mysql.com/14857) [<http://bugs.mysql.com/14857>])
- Issuing `GRANT EXECUTE` on a procedure would display any warnings related to the creation of the procedure. ([Bug#7787](http://bugs.mysql.com/7787) [<http://bugs.mysql.com/7787>])
- Attempting to add a new partition to a table partitioned by a unique key would cause an Out of memory error. ([Bug#17169](http://bugs.mysql.com/17169) [<http://bugs.mysql.com/17169>])
- In a highly concurrent environment, a server crash or deadlock could result from execution of a statement that used stored functions or activated triggers coincident with alteration of the tables used by these functions or triggers. ([Bug#16593](http://bugs.mysql.com/16593) [<http://bugs.mysql.com/16593>])

D.1.6. Changes in release 5.1.7 (27 February 2006)

Functionality added or changed:

- **Incompatible change:** `TYPE = engine_name` is no longer accepted as a synonym for the `ENGINE = engine_name` table option. (`TYPE` has been deprecated since MySQL 4.0.)
- Several changes were made to make upgrades easier:
 - Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See [Section 5.6.2, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).
 - Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
 - Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option. Added the `--fix-db-names` and `--fix-table-names` options to `mysqlcheck`.
- **Incompatible change:** The `mysql_stmt_attr_get()` C API function now returns a boolean rather than an unsigned int for `STMT_ATTR_UPDATE_MAX_LENGTH`. ([Bug#16144](http://bugs.mysql.com/16144) [<http://bugs.mysql.com/16144>])
- Added the `--wait-timeout` option to `mysqlmanager` to allow configuration of the timeout for dropping an inactive connection, and increased the default timeout from 30 seconds to 28,800 seconds (8 hours). ([Bug#12674](http://bugs.mysql.com/12674) [<http://bugs.mysql.com/12674>], [Bug#15980](http://bugs.mysql.com/15980) [<http://bugs.mysql.com/15980>])
- All subpartitions within a given partitioned table are now guaranteed to have unique names. ([Bug#15408](http://bugs.mysql.com/15408) [<http://bugs.mysql.com/15408>])
- Added the `RENAME DATABASE` statement.
- The SQL mode in effect at the time an event is created or altered is recorded and used during event execution. ([Bug#16407](http://bugs.mysql.com/16407) [<http://bugs.mysql.com/16407>])
- Added the `PROCESSLIST` table to `INFORMATION_SCHEMA`.
- Attempting to read pre-5.1.6 partitioned tables with a MySQL 5.1.7 (or later) server now generates a suitable warning message. ([Bug#16695](http://bugs.mysql.com/16695) [<http://bugs.mysql.com/16695>])

For additional information about this issue, see [Section D.1.7, “Changes in release 5.1.6 \(01 February 2006\)”](#).

- **NDB Cluster:** Attempting to `SELECT ... FROM INFORMATION_SCHEMA.FILES` now raises a warning in the event that the cluster has crashed. ([Bug#17087](#) [<http://bugs.mysql.com/17087>])
- **NDB Cluster:** It is now possible to replicate **NDB** tables having no explicit primary key. See [Section 15.10, “MySQL Cluster Replication”](#).
- Removed the `have_isam` and `have_raid` system variables.
- Status messages added to `ndb_restore` to allow users to know that data files for Disk Data are being created. ([Bug#16873](#) [<http://bugs.mysql.com/16873>])
- Added the `IN NATURAL LANGUAGE MODE` and `IN NATURAL LANGUAGE MODE WITH QUERY EXPANSION` modifiers for full-text searches. See [Section 12.7, “Full-Text Search Functions”](#).
- Creator privileges are now checked for all events before execution. ([Bug#17289](#) [<http://bugs.mysql.com/17289>])
- `CREATE EVENT`, `DROP EVENT`, and `ALTER EVENT` statements are not allowed in triggers. ([Bug#16410](#) [<http://bugs.mysql.com/16410>])
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. ([Bug#16217](#) [<http://bugs.mysql.com/16217>])
- In row-based replication, when executing a `Rows_log_event`, the associated table was locked, the rows applied and the lock released. This did not work since there are storage engines that count locks and perform an autocommit when the number of locks reach zero. Now we ensure that all table maps come before all `ROWS` events in a statement.

Bugs fixed:

- **NDB Cluster:** `ndbd` restart could sometimes fail due to incorrect memory access. ([Bug#17417](#) [<http://bugs.mysql.com/17417>])
- Execution times for scheduled events were not calculated correctly: the last execution time was used as a base rather than the actual start time. ([Bug#17494](#) [<http://bugs.mysql.com/17494>])
- Using an XPath expression containing `=` with `ExtractValue()` caused the server to crash. ([Bug#16242](#) [<http://bugs.mysql.com/16242>])
- **NDB Cluster:** An unhandled resources issue could cause node failure with a `DELETE FROM TABLE` affecting thousands of rows. ([Bug#16492](#) [<http://bugs.mysql.com/16492>])
- **NDB Cluster:** Cluster tables not having an explicit primary key could not be replicated. ([Bug#14541](#) [<http://bugs.mysql.com/14541>])
- For a transaction that used **MyISAM** and **InnoDB** tables, interruption of the transaction due to a dropped connection on a master server caused slaves to lose synchrony. ([Bug#16559](#) [<http://bugs.mysql.com/16559>])
- `SELECT` with `GROUP BY` on a view could cause a server crash. ([Bug#16382](#))

[<http://bugs.mysql.com/16382>])

- `SET TRANSACTION ISOLATION LEVEL` acted like `SET SESSION TRANSACTION ISOLATION LEVEL`. That is, it set the isolation level for longer than the next transaction. (Bug#7955 [<http://bugs.mysql.com/7955>])
- `SHOW CREATE TABLE` produced extraneous spaces after the `PRIMARY KEY` keywords. (Bug#13883 [<http://bugs.mysql.com/13883>])
- If the query optimizer transformed a `GROUP BY` clause in a subquery, it did not also transform the `HAVING` clause if there was one, producing incorrect results. (Bug#16603 [<http://bugs.mysql.com/16603>])
- `SUBSTRING_INDEX ()` could yield inconsistent results when applied with the same arguments to consecutive rows in a query. (Bug#14676 [<http://bugs.mysql.com/14676>])
- `mysam_ftdump` did not work for `FULLTEXT` indexes associated with a parser plugin. (Bug#17116 [<http://bugs.mysql.com/17116>])
- `BIT` fields were not properly handled when using row-based replication. (Bug#13418 [<http://bugs.mysql.com/13418>])
- Column counts were encoded incorrectly in the binary log for row-based logging format. (Bug#17678 [<http://bugs.mysql.com/17678>])
- Data truncations on non-`UNIQUE` indexes could crash `InnoDB` when using multi-byte character sets. (Bug#17530 [<http://bugs.mysql.com/17530>])
- An `ALTER DATABASE` statement on a replication master crashed the slaves. (Bug#17521 [<http://bugs.mysql.com/17521>])
- Partitioning with certain `SUBPARTITION BY HASH` clauses caused an error when querying for a partitioned column using an `IS NULL` comparison. (Bug#17430 [<http://bugs.mysql.com/17430>], Bug#17432 [<http://bugs.mysql.com/17432>])
- The `mysql_fix_privilege_tables.sql` script did not properly initialize the `Event_priv` column to 'Y' for those accounts that should have the `EVENT` privilege. (Bug#16400 [<http://bugs.mysql.com/16400>])
- `NDB Cluster`: Inserting the output of `REPEAT('some_string', some_int)` into a `BLOB` column resulted in the error Invalid blob attributes or invalid blob parts table. (Bug#17505 [<http://bugs.mysql.com/17505>])
- `NDB Cluster`: Row-based replication was not being set up correctly if a backup was already in progress. For example, connecting a `mysqld` instance to a cluster which was being backed up would result in the message `NDB: skipping setup table test.t1 being written to the error log`. (Bug#17459 [<http://bugs.mysql.com/17459>])
- `NDB Cluster`: `CREATE TEMPORARY TABLE` of a Cluster table would fail with an Unsupported error or crash the server. (Bug#17210 [<http://bugs.mysql.com/17210>], Bug#16552 [<http://bugs.mysql.com/16552>])
- `NDB Cluster`: `UNIQUE` keys in Cluster tables were limited to 225 bytes in length. (Bug#15918 [<http://bugs.mysql.com/15918>])
- `NDB Cluster`: `REPLACE` failed when attempting to update a primary key value in a Cluster table. (Bug#14007 [<http://bugs.mysql.com/14007>])
- `NDB Cluster`: Creating `NDB` tables containing `BLOB` columns but no primary key caused unpre-

dictable behavior. ([Bug#17559](http://bugs.mysql.com/17559) [http://bugs.mysql.com/17559])

- Creating an event and using a whitespace character other than space following the `DO` keyword caused a server crash. ([Bug#17453](http://bugs.mysql.com/17453) [http://bugs.mysql.com/17453])
- Previously, a stored function invocation was written to the binary log as `DO func_name()` if the invocation changes data and occurs within a non-logged statement, or if the function invokes a stored procedure that produces an error. These invocations now are logged as `SELECT func_name()` instead for better control over error code checking (slave servers could stop due to detecting a different error than occurred on the master). ([Bug#14769](http://bugs.mysql.com/14769) [http://bugs.mysql.com/14769])
- `CHECKSUM TABLE` returned different values on MyISAM table depending on whether the `QUICK` or `EXTENDED` options were used. ([Bug#8841](http://bugs.mysql.com/8841) [http://bugs.mysql.com/8841])
- Querying the `INFORMATION_SCHEMA.PARTITIONS` table on a non-max server caused a server crash. This also happened following the creation of a table with a very large number (hundreds) of partitions. ([Bug#16591](http://bugs.mysql.com/16591) [http://bugs.mysql.com/16591], [Bug#17141](http://bugs.mysql.com/17141) [http://bugs.mysql.com/17141])
- Attempting to add a new partition to a table partitioned by a unique key would cause an Out of memory error. ([Bug#17169](http://bugs.mysql.com/17169) [http://bugs.mysql.com/17169])
- MySQL server dropped client connection for certain `SELECT` statements against views defined that used `MERGE` algorithm. ([Bug#16260](http://bugs.mysql.com/16260) [http://bugs.mysql.com/16260])
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. ([Bug#14927](http://bugs.mysql.com/14927) [http://bugs.mysql.com/14927])
- Using `GROUP BY` on column used in `WHERE` clause could cause empty set to be returned. ([Bug#16203](http://bugs.mysql.com/16203) [http://bugs.mysql.com/16203])
- `DROP DATABASE` did not drop events for the database. ([Bug#16406](http://bugs.mysql.com/16406) [http://bugs.mysql.com/16406])
- Race conditions between event creation, dropping, and execution could result in a server crash or hang. ([Bug#17373](http://bugs.mysql.com/17373) [http://bugs.mysql.com/17373])
- `SET sql_mode = N`, where $N > 31$, did not work properly. ([Bug#13897](http://bugs.mysql.com/13897) [http://bugs.mysql.com/13897])
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. ([Bug#6536](http://bugs.mysql.com/6536) [http://bugs.mysql.com/6536])
- When used with the `ExtractValue()` function, an XPath expression having no leading “ / ” character would crash the server. ([Bug#16234](http://bugs.mysql.com/16234) [http://bugs.mysql.com/16234])
- A `SELECT` from the last partition of a subpartitioned table having a `UNIQUE KEY` could crash the MySQL Server. ([Bug#16907](http://bugs.mysql.com/16907) [http://bugs.mysql.com/16907])
- A `SELECT` on a subpartitioned table having a multiple-column `PRIMARY` or `UNIQUE KEY`, and whose partitioning function used only the first column of the key, could cause `mysqld` to crash. ([Bug#16901](http://bugs.mysql.com/16901) [http://bugs.mysql.com/16901])
- Using `REPLACE INTO` on a partitioned table having a primary key would crash the server in the event of a duplicate key error. ([Bug#16782](http://bugs.mysql.com/16782) [http://bugs.mysql.com/16782])
- `DROP TABLE` would sometimes fail on a table having subpartitions that used the default storage engine. ([Bug#16775](http://bugs.mysql.com/16775) [http://bugs.mysql.com/16775])

- **NDB Cluster**: Sharing of table names containing special characters between multiple SQL nodes was not handled correctly when binary logging was enabled (a timeout error resulted). ([Bug#17415](http://bugs.mysql.com/17415) [<http://bugs.mysql.com/17415>])
- **NDB Cluster**: Table definitions were not shared between multiple SQL nodes in a cluster without binary logging being enabled. ([Bug#17414](http://bugs.mysql.com/17414) [<http://bugs.mysql.com/17414>])
- **NDB Cluster**: Cluster log file paths were truncated to 128 characters. They may now be as long as `MAX_PATH` (the maximum path length permitted by the operating system). ([Bug#17411](http://bugs.mysql.com/17411) [<http://bugs.mysql.com/17411>])
- `SHOW CREATE EVENT` displayed no output. ([Bug#16423](http://bugs.mysql.com/16423) [<http://bugs.mysql.com/16423>])
- Statements that contained Unicode characters were not logged to the log tables correctly. ([Bug#16905](http://bugs.mysql.com/16905) [<http://bugs.mysql.com/16905>])
- On Windows platforms, some attempts to create partitioned tables from the command line would cause the `mysql` client to hang. ([Bug#17082](http://bugs.mysql.com/17082) [<http://bugs.mysql.com/17082>])
- **NDB Cluster**: `SHOW CREATE TABLE` would fail when run against a table created in a different session. ([Bug#17340](http://bugs.mysql.com/17340) [<http://bugs.mysql.com/17340>])
- **NDB Cluster**: Following multiple forced shutdowns and restarts of data nodes, `DROP DATABASE` could fail. ([Bug#17325](http://bugs.mysql.com/17325) [<http://bugs.mysql.com/17325>])
- **NDB Cluster**: An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. ([Bug#17257](http://bugs.mysql.com/17257) [<http://bugs.mysql.com/17257>])
- **NDB Cluster**: A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. ([Bug#17249](http://bugs.mysql.com/17249) [<http://bugs.mysql.com/17249>])
- The **NDB Cluster** storage engine did not allow views to be updated. ([Bug#17206](http://bugs.mysql.com/17206) [<http://bugs.mysql.com/17206>])
- **NDB Cluster**: Row-based replication of a cluster failed to take `--binlog_ignore_db settings` into account. ([Bug#17188](http://bugs.mysql.com/17188) [<http://bugs.mysql.com/17188>])
- Trying to create a partitioned table with more than 32 attributes failed. ([Bug#17179](http://bugs.mysql.com/17179) [<http://bugs.mysql.com/17179>])
- **NDB Cluster**: When attempting to import data into an **NDB** table using `LOAD DATA INFILE`, the server would hang in the event of a duplicate key error. ([Bug#17154](http://bugs.mysql.com/17154) [<http://bugs.mysql.com/17154>])
- **NDB Cluster**: In some cases, `LOAD DATA INFILE` did not load all data into **NDB** tables. ([Bug#17081](http://bugs.mysql.com/17081) [<http://bugs.mysql.com/17081>])
- **NDB Cluster**: Performing large numbers of data manipulation statements on cluster tables using Disk Data could lead to a server crash. ()
- **NDB Cluster**: In some cases, a cluster using Disk Data tables could not be restarted following a normal shutdown. ([Bug#16872](http://bugs.mysql.com/16872) [<http://bugs.mysql.com/16872>])
- **NDB Cluster**: The `REDO` log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. ([Bug#17295](http://bugs.mysql.com/17295) [<http://bugs.mysql.com/17295>])
- **NDB Cluster**: `CREATE TABLE new_tbl LIKE old_tbl;` failed when `old_tbl` used the **NDB** storage engine. ([Bug#17005](http://bugs.mysql.com/17005) [<http://bugs.mysql.com/17005>])

- **NDB Cluster**: No error message was generated for setting `NoOfFragmentLogFiles` too low. ([Bug#13966](http://bugs.mysql.com/13966) [<http://bugs.mysql.com/13966>])
- **NDB Cluster**: No error message was generated for setting `MaxNoOfAttributes` too low. ([Bug#13965](http://bugs.mysql.com/13965) [<http://bugs.mysql.com/13965>])
- The `SELECT` privilege was required for triggers that performed no selects. ([Bug#15196](http://bugs.mysql.com/15196) [<http://bugs.mysql.com/15196>])
- The `UPDATE` privilege was required for triggers that performed no updates. ([Bug#15166](http://bugs.mysql.com/15166) [<http://bugs.mysql.com/15166>])
- `CAST(. . . AS TIME)` operations returned different results when using versus not using prepared-statement protocol. ([Bug#15805](http://bugs.mysql.com/15805) [<http://bugs.mysql.com/15805>])
- Killing a long-running query containing a subquery could cause a server crash. ([Bug#14851](http://bugs.mysql.com/14851) [<http://bugs.mysql.com/14851>])
- **InnoDB** could display an incorrect error message for a cascading update. ([Bug#9680](http://bugs.mysql.com/9680) [<http://bugs.mysql.com/9680>])
- A `RETURN` statement within a trigger caused a server crash. `RETURN` now is disallowed within triggers. To exit immediately, use `LEAVE`. ([Bug#16829](http://bugs.mysql.com/16829) [<http://bugs.mysql.com/16829>])

D.1.7. Changes in release 5.1.6 (01 February 2006)

Functionality added or changed:

- **Packaging changes**: MySQL 5.1.6 introduces some changes to distribution packaging:
 - Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
 - There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
 - Server binaries no longer are stripped, except for RPM distributions.
 - Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- **Incompatible change**: This release introduces the `TRIGGER` privilege. Previously, the `SUPER` privilege was needed to create or drop triggers. Now those operations require the `TRIGGER` privilege. This is a security improvement because you no longer need to grant users the `SUPER` privilege to enable them to create triggers. However, the requirement that the account named in a trigger's `DEFINER` clause must have the `SUPER` privilege has changed to a requirement for the `TRIGGER` privilege. After upgrading, be sure to update your grant tables as described in [Section 5.6.1, “mysql_fix_privilege_tables — Upgrade MySQL System Tables”](#). This process assigns the `TRIGGER` privilege to all accounts that had the `SUPER` privilege. (After updating, you might also consider whether any of those accounts no longer need `SUPER`.) If you fail to update the grant tables, triggers may fail when activated. ([Bug#9142](http://bugs.mysql.com/9142) [<http://bugs.mysql.com/9142>])
- **Incompatible change**: Before MySQL 5.1.6, the server writes general query log and slow query log entries to log files. As of MySQL 5.1.6, the server's logging capabilities for these logs are more flexible. Log entries can be written to log files (as before) or to the `general_log` and `slow_log` tables in the `mysql` database. If logging is enabled, either or both destinations can be selected. The

`--log-output` option controls the destination or destinations of log output. See [Section 5.12.1, “Selecting General Query and Slow Query Log Output Destinations”](#).

If logging is enabled, the default destination now is to log to tables, which differs from earlier versions. If you had the server configured for logging to log files formerly, use `--log-output=FILE` to preserve this behavior after an upgrade to MySQL 5.1.6 or higher.

- **Incompatible change:** Due to a change in the naming scheme for partitioning and subpartitioning files, it is not possible for the server to read partitioned tables created in previous MySQL versions. A suggested workaround is (1) to create a non-partitioned table with the same table schema using a standard `CREATE TABLE` statement (that is, with no partitioning clauses) and then (2) to issue a `SELECT INTO` to copy the data into the non-partitioned table before the upgrade; following the upgrade, you can partition the new table using `ALTER TABLE ... PARTITION BY ...`. Alternatively, you can dump the table using `mysqldump` prior to upgrading and reload it afterwards with `LOAD DATA`. In either case, you should drop the pre-5.1.6 partitioned tables before upgrading to 5.1.6 or later. ([Bug#13437](#) [<http://bugs.mysql.com/13437>])

Important: If any partitioned tables that were created prior to MySQL 5.1.6 are present following an upgrade to MySQL 5.1.6 or later, it is also not possible to read from the `INFORMATION_SCHEMA.PARTITIONS` table, nor will you be able to drop those tables or the database or databases in which they are located. In this event, you must: (1) shut down `mysqld`; (2) manually delete the table, partition, and (if any) subpartition files; and then (3) restart the MySQL Server. ([Bug#16695](#) [<http://bugs.mysql.com/16695>])

- **Incompatible change:** Words with apostrophes are now matched in a `FULLTEXT` search against non-apostrophe words (for example, a search for `Jerry` will match against the term `Jerry's`). Users upgrading to this version must issue `REPAIR TABLE` statements for tables containing `FULLTEXT` indexes. ([Bug#14194](#) [<http://bugs.mysql.com/14194>])
- MySQL 5.1.6 introduces the *Event Scheduler* which allows one to schedule statements for execution at predetermined times. Events can be transient (one-time-only) or recurrent at regular intervals, and may execute queries and statements permitted in stored routines, including compound statements.

Events can be altered after creation, and dropped when no longer needed.

Information about scheduled events can be obtained using the statements `SHOW EVENTS` and `SHOW CREATE EVENT`, or by querying the `INFORMATION_SCHEMA.EVENTS` table. All of these are available beginning in MySQL 5.1.6.

Users must have the `EVENT` privilege (also added in 5.1.6) to create events.

For more information, see [Chapter 20, *Event Scheduler*](#).

- Replication between MySQL Clusters is now supported. It is now also possible to replicate between a MySQL Cluster and a non-cluster database. See [Section 15.10, “MySQL Cluster Replication”](#).
- Special characters in database and table identifiers now are encoded when creating the corresponding directory names and filenames. This relaxes the restrictions on the characters that can appear in identifiers. See [Section 9.2.3, “Mapping of Identifiers to Filenames”](#).
- Queries against partitioned tables can now take advantage of partition pruning. In some cases, this can result in query execution that is an order of magnitude faster than the same query against a non-partitioned version of the same table.
- The `mysqldump` utility now supports an option for dumping tablespaces. Use `-Y` or `--all-tablespaces` to enable this functionality. ([Bug#16753](#) [<http://bugs.mysql.com/16753>])
- Partition support is not an “engine”, but it was included in the output of `SHOW ENGINES`. Now it is not. ([Bug#14355](#) [<http://bugs.mysql.com/14355>]) The `have_partition_engine` variable was

renamed to `have_partitioning`. (Bug#16718 [<http://bugs.mysql.com/16718>])

- `ANALYZE TABLE` is now supported for partitioned tables. (Bug#13441 [<http://bugs.mysql.com/13441>])
- Added the `event_scheduler` system variable.
- Added the `ndb_extra_logging` system variable.
- Added the `FILES` table to `INFORMATION_SCHEMA`.
- Added the `EVENTS` table to `INFORMATION_SCHEMA`.
- Added the `PARTITIONS` table to `INFORMATION_SCHEMA`.
- The `ARCHIVE` storage engine now supports the `AUTO_INCREMENT` column attribute and the `AUTO_INCREMENT` table option. Section 14.10, “The ARCHIVE Storage Engine”.
- Added support for the `CREATE INDEX` and `DROP INDEX` statements to the `NDB Cluster` storage engine.
- Server plugins can register their own status variables to be displayed by the `SHOW STATUS` statement.

Bugs fixed:

- An indexing error sometimes caused values to be assigned to the wrong `RANGE` partition. (Bug#16684 [<http://bugs.mysql.com/16684>])
- `NDB Cluster`: `ndb_delete_all` would run out of memory on tables containing `BLOB` columns. (Bug#16693 [<http://bugs.mysql.com/16693>])
- Using the `TRUNCATE()` function with a negative number for the second argument on a `BIGINT` column returned incorrect results. (Bug#8461 [<http://bugs.mysql.com/8461>])
- When the fulltext search parser plugin returned more words than half of the length (in bytes) of the query string, the server would crash. (Bug#16722 [<http://bugs.mysql.com/16722>])
- Improper memory handling for stored routine variables could cause memory overruns and binary log corruption. (Bug#15588 [<http://bugs.mysql.com/15588>])
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. (Bug#14496 [<http://bugs.mysql.com/14496>])
- `STR_TO_DATE(1, NULL)` caused a server crash. (CVE-2006-3081 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-3081>], Bug#15828 [<http://bugs.mysql.com/15828>])
- An `INSERT` statement in a stored procedure corrupted the binary log. (Bug#16621 [<http://bugs.mysql.com/16621>])
- The `mysql_real_connect()` C API function incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value. (Bug#15719 [<http://bugs.mysql.com/15719>])
- Specifying a value for `--tmpdir` without a trailing slash had unpredictable results. (Bug#15904 [<http://bugs.mysql.com/15904>])
- Attempting to insert data into a partitioned table that used the `BLACKHOLE` storage engine caused

`mysqld` to crash. ([Bug#14524](http://bugs.mysql.com/14524) [<http://bugs.mysql.com/14524>])

- Using `RANGE` partitioning with a `CASE` statement as the partitioning function would cause records to be placed in the wrong partition. ([Bug#15393](http://bugs.mysql.com/15393) [<http://bugs.mysql.com/15393>])
- `ALTER TABLE ... ADD PARTITIONS` on a table with one partition crashed the server. ([Bug#15820](http://bugs.mysql.com/15820) [<http://bugs.mysql.com/15820>])
- NDB Cluster returned incorrect `Can't find file` error for OS error 24, changed to `Too many open files`. ([Bug#15020](http://bugs.mysql.com/15020) [<http://bugs.mysql.com/15020>])
- Multi-byte path names for `LOAD DATA` and `SELECT ... INTO OUTFILE` caused errors. Added the `character_set_filesystem` system variable, which controls the interpretation of string literals that refer to filenames. ([Bug#12448](http://bugs.mysql.com/12448) [<http://bugs.mysql.com/12448>])
- Certain subqueries where the inner query is the result of an aggregate function would return different results on MySQL 5.0 than on MySQL 4.1. ([Bug#15347](http://bugs.mysql.com/15347) [<http://bugs.mysql.com/15347>])
- The error message for specifying values for which no partition exists returned wrong values on certain platforms. ([Bug#15910](http://bugs.mysql.com/15910) [<http://bugs.mysql.com/15910>])
- Certain Japanese table names were not properly saved during a `CREATE TABLE` statement. ([Bug#3906](http://bugs.mysql.com/3906) [<http://bugs.mysql.com/3906>])
- NDB Cluster leaked disk space when performing `INSERTS/DELETES` in a loop. ([Bug#16771](http://bugs.mysql.com/16771) [<http://bugs.mysql.com/16771>])
- NDB Cluster returned wrong error when tablespace on disk was full. ([Bug#16738](http://bugs.mysql.com/16738) [<http://bugs.mysql.com/16738>])
- The `DATA DIRECTORY` and `INDEX DIRECTORY` clauses of a `CREATE TABLE` statement involving partitions did not work. ([Bug#14354](http://bugs.mysql.com/14354) [<http://bugs.mysql.com/14354>])
- Subselect could return wrong results when records cache and grouping was involved. ([Bug#15347](http://bugs.mysql.com/15347) [<http://bugs.mysql.com/15347>])
- In some cases the query optimizer did not properly perform multiple joins where inner joins followed left joins, resulting in corrupted result sets. ([Bug#15633](http://bugs.mysql.com/15633) [<http://bugs.mysql.com/15633>])
- The absence of a table in the left part of a left or right join was not checked prior to name resolution, which resulted in a server crash. ([Bug#15538](http://bugs.mysql.com/15538) [<http://bugs.mysql.com/15538>])
- **NDB Cluster:** Trying to import too many dumped tables requiring resources beyond those allocated in the cluster configuration would cause the server to crash instead of reporting an insufficient resources error. ([Bug#16455](http://bugs.mysql.com/16455) [<http://bugs.mysql.com/16455>])
- **NDB Cluster (Disk Data):** Tablespaces created using parameters with relatively low values (< 10 MB) produced filesizes much smaller than expected. ([Bug#16742](http://bugs.mysql.com/16742) [<http://bugs.mysql.com/16742>])
- **NDB Cluster:** `CREATE TABLESPACE` statements were incorrectly parsed on 64-bit platforms. (`INITIAL SIZE size` worked, but `INITIAL SIZE = size` failed.) ([Bug#13556](http://bugs.mysql.com/13556) [<http://bugs.mysql.com/13556>])
- Trying to add more than one partition in a single `ALTER TABLE ... ADD PARTITION` statement caused the server to crash. ([Bug#16534](http://bugs.mysql.com/16534) [<http://bugs.mysql.com/16534>])
- Creating a partitioned table using a storage engine other than the session default storage engine caused the server to crash. ([Bug#15966](http://bugs.mysql.com/15966) [<http://bugs.mysql.com/15966>])

- An `ALTER TABLE ... PARTITION BY ...` statement did not have any effect. (Bug#15523 [<http://bugs.mysql.com/15523>])
- `NDBCluster` (Disk Data): The error message generated by a failed `ADD UNDOFILE` did not provide any reasons for the failure. (Bug#16267 [<http://bugs.mysql.com/16267>])
- `NDBCluster` (Disk Data): `DROP LOGFILE GROUP` corrupted the cluster file system and caused `ndbd` to fail when running more than one node on the same system. (Bug#16193 [<http://bugs.mysql.com/16193>])
- `NDBCluster`: A bitfield whose offset and length totaled 32 would crash the cluster. (Bug#16125 [<http://bugs.mysql.com/16125>])
- `NDBCluster`: Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incompleted error handling of the failed node. (Bug#15908 [<http://bugs.mysql.com/15908>])
- `NDBCluster`: The `ndb_autodiscover` test failed sporadically due to a node not being permitted to connect to the cluster. (Bug#15619 [<http://bugs.mysql.com/15619>])
- Using `mysqldump` to obtain a dump of a partitioned table employing the `NDB` storage engine produced a non-functional table creation statement. (Bug#13155 [<http://bugs.mysql.com/13155>])
- `SHOW CREATE TABLE` did not display the `PARTITIONS` clause for tables partitioned by `HASH` or `KEY`. (Bug#14327 [<http://bugs.mysql.com/14327>])
- Inserting a negative value into an integer column used as the partitioning key for a table partitioned by `HASH` could cause the server to crash. (Bug#15968 [<http://bugs.mysql.com/15968>])
- With a table partitioned by `LIST`, inserting a value which was smaller than any value shown in the partitioning value-lists could cause the server to crash. (Bug#14365 [<http://bugs.mysql.com/14365>])
- `ALTER TABLE ... DROP PARTITION` would truncate all `DATE` column values in the table's remaining partitions to `NULL`. (Bug#13644 [<http://bugs.mysql.com/13644>])
- `ALTER TABLE ... ADD PARTITION` could crash the server or cause an Out of memory error in some circumstances. (Bug#13447 [<http://bugs.mysql.com/13447>])
- The server would allow foreign keys to be declared in the definition of a partitioned table despite the fact that partitioned tables do not support foreign keys (see Section 16.5, “Restrictions and Limitations on Partitioning”). (Bug#13446 [<http://bugs.mysql.com/13446>])
- A `SELECT` from a key-partitioned table with a multi-column key could cause the server to crash. (Bug#13445 [<http://bugs.mysql.com/13445>])
- Issuing a `TRUNCATE` statement twice in succession on the same partitioned table would cause the server to crash. (Bug#13442 [<http://bugs.mysql.com/13442>])
- Using a `REPLACE` statement on a partitioned table caused the server to crash. (Bug#13440 [<http://bugs.mysql.com/13440>])
- Using an identifier rather than a literal integer value in the `LESS THAN` clause of a range-partitioned table could cause the server to crash and corruption of tables. (Bug#13439 [<http://bugs.mysql.com/13439>])
- Using `ENGINE=...` within a `PARTITION` clause could cause the server to crash. (Bug#13438 [<http://bugs.mysql.com/13438>])
- `CREATE TABLE ... LIKE` did not work if the table whose schema was to be copied was a

partitioned table. ([Bug#13435](http://bugs.mysql.com/13435) [<http://bugs.mysql.com/13435>])

- `SHOW CREATE TABLE` did not display the `PARTITIONS` clause for tables partitioned by `HASH` or `KEY`. ([Bug#14327](http://bugs.mysql.com/14327) [<http://bugs.mysql.com/14327>])
- Certain permission management statements could create a `NULL` hostname for a user, resulting in a server crash. ([Bug#15598](http://bugs.mysql.com/15598) [<http://bugs.mysql.com/15598>])
- Temporary table aliasing did not work inside stored functions. ([Bug#12198](http://bugs.mysql.com/12198) [<http://bugs.mysql.com/12198>])
- Parallel builds occasionally failed on Solaris. ([Bug#16282](http://bugs.mysql.com/16282) [<http://bugs.mysql.com/16282>])

D.1.8. Changes in release 5.1.5 (10 January 2006)

Functionality added or changed:

- Added the `INFORMATION_SCHEMA ENGINES` table.
- Added the `INFORMATION_SCHEMA PLUGINS` table and the `SHOW PLUGIN` statement.
- Added the `binlog_format` system variable that controls whether to use row-based or statement-based binary logging. Added the `--binlog-format` and `--binlog-row-event-max-size` server options for binary logging control. See [Section 6.3, “Row-Based Replication”](#).
- Plugins now can have status variables that are displayed in the output from `SHOW STATUS`. See [Section 26.2.5, “Writing Plugins”](#).
- Added the XML functions `ExtractValue()` and `UpdateXML()`. `ExtractValue()` returns the content of a fragment of XML matching a given XPath expression. `UpdateXML()` replaces the element selected from a fragment of XML by an XPath expression supplied by the user with a second XML fragment (also user-supplied), and returns the modified XML. See [Section 12.9, “XML Functions”](#).
- Added the `--base64-output` option to `mysqlbinlog` to print all binary log entries using base64 encoding. This is for debugging only. Logs produced using this option should not be applied on production systems.
- Added the `--port-open-timeout` option to `mysqld` to control how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. ([Bug#15591](http://bugs.mysql.com/15591) [<http://bugs.mysql.com/15591>])
- Two new Hungarian collations are included: `utf8_hungarian_ci` and `ucs2_hungarian_ci`. These support the correct sort order for Hungarian vowels. However, they do not support the correct order for sorting Hungarian consonant contractions; this issue will be fixed in a future release.

Bugs fixed:

- `InnoDB`: An `UPDATE` statement with no index column in the `WHERE` condition locked all the rows in the table. ([Bug#3300](http://bugs.mysql.com/3300) [<http://bugs.mysql.com/3300>])
- `INSERT DELAYED` caused `mysqld` to crash. ([Bug#16095](http://bugs.mysql.com/16095) [<http://bugs.mysql.com/16095>])
- The output of `mysqldump --triggers` did not contain the `DEFINER` clause in dumped trigger

definitions. ([Bug#15110](http://bugs.mysql.com/15110) [<http://bugs.mysql.com/15110>])

- The output of `SHOW TRIGGERS` contained extraneous whitespace. ([Bug#15103](http://bugs.mysql.com/15103) [<http://bugs.mysql.com/15103>])
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. ([Bug#5390](http://bugs.mysql.com/5390) [<http://bugs.mysql.com/5390>])
- A `COMMIT` statement followed by a `ALTER TABLE` statement on a BDB table caused server crash. ([Bug#14212](http://bugs.mysql.com/14212) [<http://bugs.mysql.com/14212>])
- InnoDB: Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. ([Bug#14583](http://bugs.mysql.com/14583) [<http://bugs.mysql.com/14583>])
- Creating a trigger caused a server crash if the table or trigger database was not known because no default database had been selected. ([Bug#14863](http://bugs.mysql.com/14863) [<http://bugs.mysql.com/14863>])
- Issuing a `DROP USER` command could cause some users to encounter a `hostname is not allowed to connect to this MySQL server` error. ([Bug#15775](http://bugs.mysql.com/15775) [<http://bugs.mysql.com/15775>])
- The `--plugin_dir` option was not working. Also fix error with specifying parser name for full-text. ([Bug#16068](http://bugs.mysql.com/16068) [<http://bugs.mysql.com/16068>])
- Attempting to insert into a table partitioned by `LIST` a value less than any specified in one of the table's partition definitions resulted in a server crash. In such cases, `mysqld` now returns `ERROR 1500 (HY000): Table has no partition for value v , where v is the out-of-range value.` ([Bug#15819](http://bugs.mysql.com/15819) [<http://bugs.mysql.com/15819>])

D.1.9. Changes in release 5.1.4 (21 December 2005)

Functionality added or changed:

- Added the `mysqlslap` program, which is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients are accessing the server.
- Added the `--server-id` option to `mysqlbinlog` to enable only those events created by the server having the given server ID to be extracted. ([Bug#15485](http://bugs.mysql.com/15485) [<http://bugs.mysql.com/15485>])
- It is now possible to build the server such that `MyISAM` tables can support up to 128 keys rather than the standard 64. This can be done by configuring the build using the option `--with-max-indexes=N`, where $N \leq 128$ is the maximum number of indexes to permit per table. ([Bug#10932](http://bugs.mysql.com/10932) [<http://bugs.mysql.com/10932>])
- The bundled `BDB` library was upgraded to version 4.4.16.
- Added the `cp1250_polish_ci` collation for the `cp1250` character set.
- Added the `myisam_use_mmap` system variable.
- Added the `--bdb-data-direct` and `--bdb-log-direct` server options.

Bugs fixed:

- `SHOW ENGINES` output showed the `FEDERATED` engine as `DISABLED` even for builds with `FEDERATED` support. (Bug#15559 [http://bugs.mysql.com/15559])
- Server could not be built on default Debian systems with BDB enabled. (Bug#15734 [http://bugs.mysql.com/15734])
- `BDB`: A `DELETE`, `INSERT`, or `UPDATE` of a `BDB` table could cause the server to crash where the query contained a subquery using an index read. (Bug#15536 [http://bugs.mysql.com/15536])
- A left join on a column that having a `NULL` value could cause the server to crash. (Bug#15268 [http://bugs.mysql.com/15268])
- It was not possible to reorganize a partition reusing a discarded partition name.

Now, for example, you can create a table such as this one:

```
CREATE TABLE t1 (a INT)
PARTITION BY RANGE (a) (
  PARTITION p0 VALUES LESS THAN (10),
  PARTITION p1 VALUES LESS THAN (20),
  PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

and then repartition it as shown here:

```
ALTER TABLE t1 REORGANIZE PARTITION p2 INTO (
  PARTITION p2 VALUES LESS THAN (30)
);
```

Previously, attempting to do so would produce the error All partitions must have unique names in the table . (Bug#15521 [http://bugs.mysql.com/15521])

- `NDB Cluster`: The `--ndb` option for `pererror` did not function. (Bug#15486 [http://bugs.mysql.com/15486])
- The `BLACKHOLE` storage engine did not handle transactions properly: Rolled-back transactions were written to the binary log. Now they are not. (Bug#15406 [http://bugs.mysql.com/15406])
- `NDB Cluster`: Using `ORDER BY primary_key_column` when selecting from a table having the primary key on a `VARCHAR` column caused a forced shutdown of the cluster. (Bug#14828 [http://bugs.mysql.com/14828], Bug#15240 [http://bugs.mysql.com/15240], Bug#15682 [http://bugs.mysql.com/15682], Bug#15517 [http://bugs.mysql.com/15517])
- `ANALYZE TABLE` did not properly update table statistics for a `MyISAM` table with a `FULLTEXT` index containing stopwords, so a subsequent `ANALYZE TABLE` would not recognize the table as having already been analyzed. (Bug#14902 [http://bugs.mysql.com/14902])
- The maximum value of `MAX_ROWS` was handled incorrectly on 64-bit systems. (Bug#14155 [http://bugs.mysql.com/14155])
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. (Bug#15028 [http://bugs.mysql.com/15028])
- `SELECT` queries that began with an opening parenthesis were not being placed in the query cache. (Bug#14652 [http://bugs.mysql.com/14652])
- Space truncation was being ignored when inserting into `BINARY` or `VARBINARY` columns. Now space truncation results in a warning, or an error in strict mode. (Bug#14299 [http://bugs.mysql.com/14299])

- Selecting from a view processed with the temptable algorithm caused a server crash if the query cache was enabled. ([Bug#15119](http://bugs.mysql.com/15119) [<http://bugs.mysql.com/15119>])
- Creating a view that referenced a stored function that selected from a view caused a crash upon selection from the view. ([Bug#15096](http://bugs.mysql.com/15096) [<http://bugs.mysql.com/15096>])
- Creating a view within a stored procedure could result in an out of memory error or a server crash. ([Bug#14885](http://bugs.mysql.com/14885) [<http://bugs.mysql.com/14885>])
- `SHOW CREATE DATABASE` was sometimes refused when the client had privileges for the database. ([Bug#9785](http://bugs.mysql.com/9785) [<http://bugs.mysql.com/9785>])
- `mysql` ignored the `MYSQL_TCP_PORT` environment variable. ([Bug#5792](http://bugs.mysql.com/5792) [<http://bugs.mysql.com/5792>])
- `ROW_COUNT()` returned an incorrect result after `EXECUTE` of a prepared statement. ([Bug#14956](http://bugs.mysql.com/14956) [<http://bugs.mysql.com/14956>])
- Invalid casts to `DATE` values now result in a message of `Incorrect datetime value`, rather than `Truncated incorrect datetime value`. ([Bug#8294](http://bugs.mysql.com/8294) [<http://bugs.mysql.com/8294>])
- Attempts to assign `NULL` to a `NOT NULL` column in strict mode now result in a message of `Column 'col_name' cannot be null`, rather than `Column set to default value; NULL supplied to NOT NULL column 'col_name' at row n`. ([Bug#11491](http://bugs.mysql.com/11491) [<http://bugs.mysql.com/11491>])
- For binary string data types, `mysqldump --hex-blob` produced an illegal output value of `0x` rather than `' '`. ([Bug#13318](http://bugs.mysql.com/13318) [<http://bugs.mysql.com/13318>])
- Some comparisons for the `IN()` operator were inconsistent with equivalent comparisons for the `=` operator. ([Bug#12612](http://bugs.mysql.com/12612) [<http://bugs.mysql.com/12612>])

D.1.10. Changes in release 5.1.3 (29 November 2005)

Functionality added or changed:

This is the first public alpha release of the current MySQL 5.1 development branch, providing an insight to upcoming features. Although some of these are still under heavy development, this release includes the following new features and changes (in comparison to the current MySQL 5.0 production release):

- **Partitioning:** allows distributing portions of individual tables across a filesystem, according to rules which can be set when the table is created. In effect, different portions of a table are stored as separate tables in different locations, but from the user point of view, the partitioned table is still a single table. See [Chapter 16, Partitioning](#), for further information on this functionality. (Author: Mikael Ronström)
- **Plugin API:** MySQL 5.1 adds support for a very flexible plugin API that enables loading and unloading of various components at runtime, without restarting the server. Although the work on this is not finished yet, *plugin full-text parsers* are a first step in this direction. This allows users to implement their own input filter on the indexed text, enabling full-text search capability on arbitrary data such as PDF files or other document formats. A pre-parser full-text plugin performs the actual parsing and extraction of the text and hands it over to the built-in MySQL full-text search. (Author: Sergey Vojtovich)

The plugin API requires the `mysql.plugin` table. When upgrading from an older version of MySQL, you should run the `mysql_fix_privilege_tables` command to create this table.

See [Section 5.6.1](#), “`mysql_fix_privilege_tables` — Upgrade MySQL System Tables”.

Incompatible change: Plugins are installed in the directory named by the `plugin_dir` system variable. This variable also controls the location from which the server loads user-defined functions (UDFs), which is a change from earlier versions of MySQL. That is, all UDF library files now must be installed in the plugin directory. When upgrading from an older version of MySQL, you must migrate your UDF files to the plugin directory.

- **The Instance Manager (IM)** now has some additional functionality:
 - `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
 - `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)
 - `SET instance_name.option_name=option_value` sets an option to the specified value and writes it to the config file See [Section 5.5](#), “`mysqlmanager` — The MySQL Instance Manager”, for more details on these new commands. (Author: Petr Chardin)
- The performance of boolean full-text searches (using the “+” Operator) has been improved. See [Section 12.7](#), “Full-Text Search Functions”, for more details about full-text searching. (Author: Sergey Vojtovich)
- `VARCHAR` fields used in MySQL Cluster tables are now variable-sized; that is, they now only allocate as much space as required to store the data. Previously, a `VARCHAR(n)` column allocated $n+2$ bytes (aligned to 4 bytes), regardless if the actual inserted value required that much space. (In other words, a `VARCHAR` column always required the same, fixed, amount of storage as a `CHAR` column of the same size.)
- Renamed the `table_cache` system variable to `table_open_cache`. Any scripts that refer to `table_cache` should be updated to use the new name.
- Added the `table_definition_cache` system variable. If you use a large number of tables, you can create a large table definition cache to speed up opening of tables. The table definition cache takes less space and does not use file descriptors, unlike the normal table cache.
- Added the `SHOW AUTHORS` statement.

Bugs fixed:

- Set functions could not be aggregated in outer subqueries. ([Bug#12762](#) [<http://bugs.mysql.com/12762>])

D.1.11. Changes in release 5.1.2 (Not released)

Functionality added or changed:

- Added `MAXLOCKS`, `MINLOCKS`, `MAXWRITE`, and `MINWRITE` as allowable values of the `-bdb-lock-detect` option. ([Bug#14876](#) [<http://bugs.mysql.com/14876>])
- Added the `bdb_cache_parts` and `bdb_region_size` system variables, and allowed `bdb_cache_size` to be larger than 4GB on systems that support it. ([Bug#14895](#) [<http://bugs.mysql.com/14895>])

- Added `Transactions`, `XA`, and `Savepoints` columns to `SHOW ENGINES` output.
- Added `--replace` to `mysqldump`. This option uses `REPLACE INTO`, rather than `INSERT INTO`, when writing the dumpfile.

Bugs fixed:

- Foreign keys were not properly enforced in `TEMPORARY` tables. Foreign keys now are disallowed in `TEMPORARY` tables. ([Bug#12084](http://bugs.mysql.com/12084) [<http://bugs.mysql.com/12084>])

D.1.12. Changes in release 5.1.1 (Not released)

Functionality added or changed:

Bugs fixed:

- Performing a `CREATE TABLE` statement with a `PARTITION BY` clause in a prepared statement could crash a server running in debug mode. ([Bug#12097](http://bugs.mysql.com/12097) [<http://bugs.mysql.com/12097>])
- `NDB`: Specifying the wrong nodegroup in a `CREATE TABLE` using partitioning would lead to the table name being locked after the `CREATE TABLE` statement failed (that is, the table name could not be re-used). ([Bug#12114](http://bugs.mysql.com/12114) [<http://bugs.mysql.com/12114>])
- Using `ORDER BY` in a query with a partitioned table on a 64-bit operating system could crash the server. ([Bug#12116](http://bugs.mysql.com/12116) [<http://bugs.mysql.com/12116>])
- When two threads competed for the same table, a deadlock could occur if one thread also had a lock on another table through `LOCK TABLES` and the thread was attempting to remove the table in some manner while the other thread tried to place locks on both tables. ([Bug#10600](http://bugs.mysql.com/10600) [<http://bugs.mysql.com/10600>])

D.2. MySQL Connector/ODBC (MyODBC) Change History

D.2.1. Changes in MyODBC 3.51.13

Functionality added or changed:

- N/A

Bugs fixed:

- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](http://bugs.mysql.com/20547) [<http://bugs.mysql.com/20547>])
- The `SQLDriverConnect ()` ODBC method did not work with recent MyODBC releases. ([Bug#12393](http://bugs.mysql.com/12393) [<http://bugs.mysql.com/12393>])

D.2.2. Changes in MyODBC 3.51.12

Functionality added or changed:

- N/A

Bugs fixed:

- File DSNs could not be saved. ([Bug#12019](#) [<http://bugs.mysql.com/12019>])
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#) [<http://bugs.mysql.com/9539>])

D.2.3. Changes in MyODBC 3.51.11

Functionality added or changed: No changes.

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#) [<http://bugs.mysql.com/8198>])
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#) [<http://bugs.mysql.com/8138>])

D.3. MySQL Connector/NET Change History

D.3.1. Version 5.0.1 (not yet released)

Functionality added or changed:

- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. ([Bug#18391](#) [<http://bugs.mysql.com/18391>])
- Starting a transaction on a connection created by `MySQL.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. ([Bug#22042](#) [<http://bugs.mysql.com/22042>])
- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#) [<http://bugs.mysql.com/22452>])
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#) [<http://bugs.mysql.com/19994>])
- The `MySqlException` class is now derived from the `DbException` class. ([Bug#21874](#))

[<http://bugs.mysql.com/21874>])

Bugs fixed:

- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` ([Bug#7248](http://bugs.mysql.com/7248) [<http://bugs.mysql.com/7248>])
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](http://bugs.mysql.com/21521) [<http://bugs.mysql.com/21521>])

D.3.2. Version 5.0.0

This is a new Alpha development release, fixing recently discovered bugs.

NOTE: This Alpha release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

Bugs fixed:

- `CommandText`: Question mark in comment line is being parsed as a parameter. ([Bug#6214](http://bugs.mysql.com/6214) [<http://bugs.mysql.com/6214>])

Functionality added or changed:

- Implemented Usage Advisor.
- Added Async query methods.
- Reimplemented `PacketReader/PacketWriter` support into `MySQLStream` class.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented `MySQLConnectionBuilder` class.
- Implemented `MySQLClientFactory` class.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Replaced use of `ICSharpCode` with .NET 2.0 internal deflate support.

- Refactored test suite to test all protocols in a single pass.
- Completely refactored how column values are handled to avoid boxing in some cases.

D.3.3. Version 1.0.8 (not yet released)

Bugs fixed:

- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131 [<http://bugs.mysql.com/8131>])
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391 [<http://bugs.mysql.com/18391>])
- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug#22452 [<http://bugs.mysql.com/22452>])
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994 [<http://bugs.mysql.com/19994>])
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248 [<http://bugs.mysql.com/7248>])
- Calling `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no parameters would cause an application crash. (Bug#15077 [<http://bugs.mysql.com/15077>])
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug#17736 [<http://bugs.mysql.com/17736>])
- The `#` would not be accepted within column/table names, even though it was valid. (Bug#21521 [<http://bugs.mysql.com/21521>])
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581 [<http://bugs.mysql.com/20581>])
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294 [<http://bugs.mysql.com/19294>])
- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814 [<http://bugs.mysql.com/17814>])
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515 [<http://bugs.mysql.com/19515>])
- When running a query that included a date comparison, a `DateReader` error would be raised. (Bug#19481 [<http://bugs.mysql.com/19481>])
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261 [<http://bugs.mysql.com/19261>])
- When working with multiple threads, character set initialization would generate errors. (Bug#17106

[<http://bugs.mysql.com/17106>])

- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. ([Bug#16934](#) [<http://bugs.mysql.com/16934>])
- The connection string parser did not allow single or double quotes in the password. ([Bug#16659](#) [<http://bugs.mysql.com/16659>])
- The CommandBuilder ignored Unsigned flag at Parameter creation. ([Bug#17375](#) [<http://bugs.mysql.com/17375>])
- CHAR type added to MySqlCommandType. ([Bug#17749](#) [<http://bugs.mysql.com/17749>])
- Unsigned data types were not properly supported. ([Bug#16788](#) [<http://bugs.mysql.com/16788>])

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

D.3.4. Version 1.0.7

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. ([Bug#18570](#) [<http://bugs.mysql.com/18570>])
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. ([Bug#13927](#) [<http://bugs.mysql.com/13927>])
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. ([Bug#14631](#) [<http://bugs.mysql.com/14631>])
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. ([Bug#13632](#) [<http://bugs.mysql.com/13632>])
- Added support for the `cp932` character set. ([Bug#13806](#) [<http://bugs.mysql.com/13806>])
- Calling a stored procedure where a parameter contained special characters (such as `'@'`) would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. ([Bug#13753](#) [<http://bugs.mysql.com/13753>])
- A statement that contained multiple references to the same parameter could not be prepared. ([Bug#13541](#) [<http://bugs.mysql.com/13541>])
- The `Ping()` method did not update the `State` property of the `Connection` object. ([Bug#13658](#) [<http://bugs.mysql.com/13658>])

D.3.5. Version 1.0.6

- The `nant` build sequence had problems. ([Bug#12978](http://bugs.mysql.com/12978) [<http://bugs.mysql.com/12978>])
- Serializing a parameter failed if the first value passed in was `NULL`. ([Bug#13276](http://bugs.mysql.com/13276) [<http://bugs.mysql.com/13276>])
- Field names that contained the following characters caused errors: `() % < > /` ([Bug#13036](http://bugs.mysql.com/13036) [<http://bugs.mysql.com/13036>])
- The MySQL Connector/NET 1.0.5 installer would not install alongside MySQL Connector/NET 1.0.4. ([Bug#12835](http://bugs.mysql.com/12835) [<http://bugs.mysql.com/12835>])
- MySQL Connector/NET 1.0.5 could not connect on Mono. ([Bug#13345](http://bugs.mysql.com/13345) [<http://bugs.mysql.com/13345>])

D.3.6. Version 1.0.5

- With multiple hosts in the connection string, MySQL Connector/NET would not connect to the last host in the list. ([Bug#12628](http://bugs.mysql.com/12628) [<http://bugs.mysql.com/12628>])
- MySQL Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](http://bugs.mysql.com/11294) [<http://bugs.mysql.com/11294>])
- The `cp1250` character set was not supported. ([Bug#11621](http://bugs.mysql.com/11621) [<http://bugs.mysql.com/11621>])
- Connection could fail when `.NET` thread pool had no available worker threads. ([Bug#10637](http://bugs.mysql.com/10637) [<http://bugs.mysql.com/10637>])
- Decimal parameters caused syntax errors. ([Bug#11550](http://bugs.mysql.com/11550) [<http://bugs.mysql.com/11550>], [Bug#10486](http://bugs.mysql.com/10486) [<http://bugs.mysql.com/10486>], [Bug#10152](http://bugs.mysql.com/10152) [<http://bugs.mysql.com/10152>])
- A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](http://bugs.mysql.com/11542) [<http://bugs.mysql.com/11542>])
- Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](http://bugs.mysql.com/11490) [<http://bugs.mysql.com/11490>])
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](http://bugs.mysql.com/8382) [<http://bugs.mysql.com/8382>])
- MySQL Connector/NET could not work properly with certain regional settings. (WL#8228)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](http://bugs.mysql.com/11450) [<http://bugs.mysql.com/11450>])
- Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](http://bugs.mysql.com/7951) [<http://bugs.mysql.com/7951>])
- Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](http://bugs.mysql.com/9722) [<http://bugs.mysql.com/9722>])
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](http://bugs.mysql.com/10281) [<http://bugs.mysql.com/10281>])
- Added support to call a stored function from MySQL Connector/NET. ([Bug#10644](http://bugs.mysql.com/10644) [<http://bugs.mysql.com/10644>])
- MySQL Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](http://bugs.mysql.com/12771) [<http://bugs.mysql.com/12771>])

[<http://bugs.mysql.com/12771>])

- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. (Bug#12551 [<http://bugs.mysql.com/12551>], Bug#8724 [<http://bugs.mysql.com/8724>])

D.3.7. Version 1.0.4 1-20-05

- Bug#7243 [<http://bugs.mysql.com/7243>] calling prepare causing exception [fixed]
- Fixed another small problem with prepared statements
- Bug#7258 [<http://bugs.mysql.com/7258>] `MySqlCommand.Connection` returns an `IDbConnection` [fixed]
- Bug#7345 [<http://bugs.mysql.com/7345>] `MySqlAdapter.Fill` method throws Error message : Non-negative number required [fixed]
- Bug#7478 [<http://bugs.mysql.com/7478>] Clone method bug in `MySqlCommand` [fixed]
- Bug#7612 [<http://bugs.mysql.com/7612>] `MySqlDataReader.GetString(index)` returns non-Null value when field is Null [fixed]
- Bug#7755 [<http://bugs.mysql.com/7755>] `MySqlReader.GetInt32` throws exception if column is unsigned [fixed]
- Bug#7704 [<http://bugs.mysql.com/7704>] `GetBytes` is working no more [fixed]
- Bug#7724 [<http://bugs.mysql.com/7724>] Quote character `\222` not quoted in `EscapeString` [fixed]
- Fixed problem that causes named pipes to not work with some blob functionality
- Fixed problem with shared memory connections
- Bug#7436 [<http://bugs.mysql.com/7436>] Problem with Multiple resultsets... [fixed]
- Added or filled out several more topics in the API reference documentation

D.3.8. Version 1.0.3-gamma 12-10-04

- Made MySQL the default named pipe name
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids
- Fixed Invalid character set index: 200 (Bug#6547 [<http://bugs.mysql.com/6547>])
- Installer now includes options to install into GAC and create Start Menu items
- Bug#6863 [<http://bugs.mysql.com/6863>] - Int64 Support in `MySqlCommand` Parameters [fixed]
- Connections now do not have to give a database on the connection string
- Bug#6770 [<http://bugs.mysql.com/6770>] - `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` Exception [fixed]

- Fixed problem where multiple resultsets having different numbers of columns would cause a problem
- [Bug#6983](http://bugs.mysql.com/6983) [http://bugs.mysql.com/6983] Exception stack trace lost when re-throwing exceptions [fixed]
- Fixed major problem with detecting null values when using prepared statements
- [Bug#6902](http://bugs.mysql.com/6902) [http://bugs.mysql.com/6902] Errors in parsing stored procedure parameters [fixed]
- [Bug#6668](http://bugs.mysql.com/6668) [http://bugs.mysql.com/6668] Integer "out" parameter from stored procedure returned as string [fixed]
- [Bug#7032](http://bugs.mysql.com/7032) [http://bugs.mysql.com/7032] MySqlConnection in Datatables sorting by Text, not Date. [fixed]
- [Bug#7133](http://bugs.mysql.com/7133) [http://bugs.mysql.com/7133] Invalid query string when using inout parameters [fixed]
- [Bug#6831](http://bugs.mysql.com/6831) [http://bugs.mysql.com/6831] Test suite fails with MySQL 4.0 because of case sensitivity of table names [fixed]
- [Bug#7132](http://bugs.mysql.com/7132) [http://bugs.mysql.com/7132] Inserting DateTime causes System.InvalidCastException to be thrown [fixed]
- [Bug#6879](http://bugs.mysql.com/6879) [http://bugs.mysql.com/6879] InvalidCast when using DATE_ADD-function [fixed]
- [Bug#6634](http://bugs.mysql.com/6634) [http://bugs.mysql.com/6634] An Open Connection has been Closed by the Host System [fixed]
- Added ServerThread property to MySqlConnection to expose server thread id
- Added Ping method to MySqlConnection
- Changed the name of the test suite to MySql.Data.Tests.dll

D.3.9. Version 1.0.2-gamma 04-11-15

- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Fixed Installation directory ignored using custom installation ([Bug#6329](http://bugs.mysql.com/6329) [http://bugs.mysql.com/6329])
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed double type handling in MySqlParameter(string parameterName, object value) ([Bug#6428](http://bugs.mysql.com/6428) [http://bugs.mysql.com/6428])
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](http://bugs.mysql.com/6429) [http://bugs.mysql.com/6429])
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.
- Added charset connection string option
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ ([Bug#6322](http://bugs.mysql.com/6322) [http://bugs.mysql.com/6322])

- Added the TableEditor CS and VB sample
- Fixed Charset-map for UCS-2 ([Bug#6541](http://bugs.mysql.com/6541) [<http://bugs.mysql.com/6541>])
- Updated the installer to include the new samples
- Fixed Long inserts take very long time (Bu #5453)
- Fixed Objects not being disposed ([Bug#6649](http://bugs.mysql.com/6649) [<http://bugs.mysql.com/6649>])
- Provider is now using character set specified by server as default

D.3.10. Version 1.0.1-beta2 04-10-27

- Fixed [Bug#5602](http://bugs.mysql.com/5602) [<http://bugs.mysql.com/5602>] Possible bug in MySqlCommandParameter(string, object) constructor
- Fixed [Bug#5458](http://bugs.mysql.com/5458) [<http://bugs.mysql.com/5458>] Calling GetChars on a longtext column throws an exception
- Fixed [Bug#5474](http://bugs.mysql.com/5474) [<http://bugs.mysql.com/5474>] cannot run a stored procedure populating mysqlcommand.parameters
- Fixed [Bug#5469](http://bugs.mysql.com/5469) [<http://bugs.mysql.com/5469>] Setting DbType throws NullReferenceException
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed [Bug#5392](http://bugs.mysql.com/5392) [<http://bugs.mysql.com/5392>] MySqlCommand sees "?" as parameters in string literals
- Fixed problem with ConnectionInternal where a key might be added more than once
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5388](http://bugs.mysql.com/5388) [<http://bugs.mysql.com/5388>] DataReader reports all rows as NULL if one row is NULL
- Virtualized driver subsystem so future releases could easily support client or embedded server support
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed problem where using old syntax while using the interfaces caused problems
- Using PacketWriter instead of Packet for writing to streams
- Refactored compression code into CompressedStream to clean up NativeDriver
- Added test case for resetting the command text on a prepared command
- Fixed problem where MySqlCommandParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](http://bugs.mysql.com/5621) [<http://bugs.mysql.com/5621>])
- Fixed constructor initialize problems in MySqlCommand() ([Bug#5613](http://bugs.mysql.com/5613) [<http://bugs.mysql.com/5613>])
- Fixed Parsing the ';' char ([Bug#5876](http://bugs.mysql.com/5876) [<http://bugs.mysql.com/5876>])

- Fixed missing Reference in DbType setter ([Bug#5897](http://bugs.mysql.com/5897) [<http://bugs.mysql.com/5897>])
- Fixed System.OverflowException when using YEAR datatype ([Bug#6036](http://bugs.mysql.com/6036) [<http://bugs.mysql.com/6036>])
- Added Aggregate function test (wasn't really a bug)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](http://bugs.mysql.com/5900) [<http://bugs.mysql.com/5900>])
- IsNullable error ([Bug#5796](http://bugs.mysql.com/5796) [<http://bugs.mysql.com/5796>])
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed problem where Min Pool Size was not being respected
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](http://bugs.mysql.com/5256) [<http://bugs.mysql.com/5256>])
- Implemented SequentialAccess
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found ([Bug#6006](http://bugs.mysql.com/6006) [<http://bugs.mysql.com/6006>])
- Fixed Can't display Chinese correctly ([Bug#5288](http://bugs.mysql.com/5288) [<http://bugs.mysql.com/5288>])
- Fixed Russian character support as well
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters ([Bug#6217](http://bugs.mysql.com/6217) [<http://bugs.mysql.com/6217>])
- Fixed NET Connector source missing resx files ([Bug#6216](http://bugs.mysql.com/6216) [<http://bugs.mysql.com/6216>])
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](http://bugs.mysql.com/5798) [<http://bugs.mysql.com/5798>])
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](http://bugs.mysql.com/5496) [<http://bugs.mysql.com/5496>])
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed GetBoolean returns wrong values ([Bug#6227](http://bugs.mysql.com/6227) [<http://bugs.mysql.com/6227>])
- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) ([Bug#6230](http://bugs.mysql.com/6230) [<http://bugs.mysql.com/6230>])

D.3.11. Version 1.0.0 04-09-01

- Fixed BUG# 3889 Thai encoding not correctly supported
- Updated many of the test cases
- Fixed problem with using compression
- Bumped version number to 1.0.0 for beta 1 release

- Added COPYING.rtf file for use in installer
- Removed all of the XML comment warnings (I'll clean them up better later)
- Removed some last references to ByteFX

D.3.12. Version 0.9.0 04-08-30

- Added test fixture for prepared statements
- All type classes now implement a SerializeBinary method for sending their data to a PacketWriter
- Added PacketWriter class that will enable future low-memory large object handling
- Fixed many small bugs in running prepared statements and stored procedures
- Changed command so that an exception will not be throw in executing a stored procedure with parameters in old syntax mode
- SingleRow behavior now working right even with limit
- GetBytes now only works on binary columns
- Logger now truncates long sql commands so blob columns don't blow out our log
- host and database now have a default value of "" unless otherwise set
- FIXED BUG# 5214 Connection Timeout seems to be ignored
- Added test case for bug# 5051: GetSchema not working correctly
- Fixed problem where GetSchema would return false for IsUnique when the column is key
- MySqlDataReader GetXXX methods now using the field level MySqlValue object and not performing conversions
- FIXED BUG# 5097: DataReader returning NULL for time column
- Added test case for LOAD DATA LOCAL INFILE
- Added replacetext custom nant task
- Added CommandBuilderTest fixture
- Added Last One Wins feature to CommandBuilder
- Fixed persist security info case problem
- Fixed GetBool so that 1, true, "true", and "yes" all count as trueWL# 2024 Make parameter mark configurable
- Added the "old syntax" connection string parameter to allow use of @ parameter marker
- Fixed [Bug#4658](http://bugs.mysql.com/4658) [http://bugs.mysql.com/4658] MySqlCommandBuilder
- Fixed [Bug#4864](http://bugs.mysql.com/4864) [http://bugs.mysql.com/4864] ByteFX.MySqlClient caches passwords if 'Persist Security Info' is false

- Updated license banner in all source files to include FLOSS exception
- Added new .Types namespace and implementations for most current MySql types
- Added MySqlField41 as a subclass of MySqlField
- Changed many classes to now use the new .Types types
- Changed type enum int to Int32, short to Int16, and bigint to Int64
- Added dummy types UInt16, UInt32, and UInt64 to allow an unsigned parameter to be made
- Connections are now reset when they are pulled from the connection pool
- Refactored auth code in driver so it can be used for both auth and reset
- Added UserReset test in PoolingTests.cs
- Connections are now reset using COM_CHANGE_USER when pulled from the pool
- Implemented SingleResultSet behavior
- Implemented support of unicode
- Added char set mappings for utf-8 and ucs-2
- fixed [Bug#4520](http://bugs.mysql.com/4520) [http://bugs.mysql.com/4520] time fields overflow using bytefx .net mysql driver
- Modified time test in data type test fixture to check for time spans where hours > 24
- Fixed [Bug#4505](http://bugs.mysql.com/4505) [http://bugs.mysql.com/4505] Wrong string with backslash escaping in Byte-Fx.Data.MySqlClient.MySqlParameter
- Added code to Parameter test case TestQuoting to test for backslashes
- Fixed [Bug#4486](http://bugs.mysql.com/4486) [http://bugs.mysql.com/4486] mysqlcommandbuilder fails with multi-word column names
- Fixed bug in TokenizeSql where underscore would terminate character capture in parameter name
- Added test case for spaces in column names
- Fixed bug# 4324 - MySqlDataReader.GetBytes don't works correctly
- Added GetBytes() test case to DataReader test fixture
- Now reading all server variables in InternalConnection.Configure into Hashtable
- Now using string[] for index map in CharSetMap
- Added CRInSQL test case for carriage returns in SQL
- setting maxPacketSize to default value in Driver.ctor
- Fixed [Bug#4442](http://bugs.mysql.com/4442) [http://bugs.mysql.com/4442] - Setting MySqlDbType on a parameter doesn't set generic type
- Removed obsolete data types Long and LongLong
- Fixed bug# 4071 - Overflow exception thrown when using "use pipe" on connection string

- Changed "use pipe" keyword to "pipe name" or just "pipe"
- Allow reading multiple resultsets from a single query
- Added flags attribute to ServerStatusFlags enum
- Changed name of ServerStatus enum to ServerStatusFlags
- Fixed [Bug#4386](http://bugs.mysql.com/4386) [http://bugs.mysql.com/4386] - Inserted data row doesn't update properly
- Fixed [Bug#4074](http://bugs.mysql.com/4074) [http://bugs.mysql.com/4074] - Error processing show create table
- Change Packet.ReadLenInteger to ReadPackedLong and added packet.ReadPackedInteger that always reads integers packed with 2,3,4
- Added syntax.cs test fixture to test various SQL syntax bugs
- Fixed bug# 4149 Improper handling of time values. Now time value of 00:00:00 is not treated as null.
- Moved all test suite files into TestSuite folder
- Fixed bug where null column would move the result packet pointer backward
- Added new nant build script
- Fixed [Bug#3917](http://bugs.mysql.com/3917) [http://bugs.mysql.com/3917] - clear tablename so it will be regen'ed properly during the next GenerateSchema.
- Fixed [Bug#3915](http://bugs.mysql.com/3915) [http://bugs.mysql.com/3915] - GetValues was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in.
- Implemented shared memory access protocol
- Implemented prepared statements for MySQL 4.1
- Implemented stored procedures for MySQL 5.0
- Renamed MySqlInternalConnection to InternalConnection
- SQL is now parsed as chars, fixes problems with other languages
- Added logging and allow batch connection string options
- Fixed [Bug#3888](http://bugs.mysql.com/3888) [http://bugs.mysql.com/3888] - RowUpdating event not set when setting the DataAdapter property
- Fixed bug in char set mapping
- Implemented 4.1 authentication
- Improved open/auth code in driver
- Improved how connection bits are set during connection
- Database name is now passed to server during initial handshake
- Changed namespace for client to MySql.Data.MySqlClient
- Changed assembly name of client to MySql.Data.dll

- Changed license text in all source files to GPL
- Added the MySqlConnection.build Nant file
- Removed the mono batch files
- Moved some of the unused files into notused folder so nant build file can use wildcards
- Implemented shared memory accesss
- Major revamp in code structure
- Prepared statements now working for MySql 4.1.1 and later
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1
- Changed namespace from MySQL.Data.MySQLClient back to MySql.Data.MySqlClient
- Fixed bug in CharSetMapping where it was trying to use text names as ints
- Changed namespace to MySQL.Data.MySQLClient
- Integrated auth changes from UC2004
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli <morelli.luca@iol.it>)
- Added TimeSpan code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo <g.colombo@alfi.it>)
- Added TimeStamp to parameter serialization code. Prevented DataAdatper updates from working right (thanks MIchael King)
- Fixed a misspelling in MySqlHelper.cs (thanks Patrick Kristiansen)

D.3.13. Version 0.76

- Driver now using charset number given in handshake to create encoding
- Changed command editor to point to MySqlConnection.Design
- Fixed bug in Version.isAtLeast
- Changed DBConnectionString to support changes done to MySqlConnectionString
- Removed SqlCommandEditor and DataAdapterPreviewDialog
- Using new long return values in many places
- Integrated new CompressedStream class
- Changed ConnectionString and added attributes to allow it to be used in MySqlConnection.Design
- Changed packet.cs to support newer lengths in ReadLenInteger
- changed other classes to use new properties and fields of MySqlConnectionString

- ConnectionInternal is now using PING to see whether the server is alive
- Moved toolbox bitmaps into resource/
- Changed field.cs to allow values to come directly from row buffer
- Changed to use the new driver.Send syntax
- Using a new packet queueing system
- started work handling the "broken" compression packet handling
- Fixed bug in StreamCreator where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella)
- Improved connectstring handling
- Moved designers into Pro product
- Removed some old commented out code from command.cs
- Fixed a problem with compression
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline)
- Added GUID support
- Fixed sequence out of order bug (thanks Mark Reay)

D.3.14. Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi)
- Year datatype now supported
- fixed compression
- Fixed bug where a parameter with a TimeSpan as the value would not serialize properly
- Fixed bug where default ctor would not set default connection string values
- Added some XML comments to some members
- Work to fix/improve compression handling
- Improved ConnectionString handling so that it better matches the standard set by SqlConnection.
- A MySqlConnection is now thrown if a username is not included in the connection string
- Localhost is now used as the default if not specified on the connection string
- An exception is now thrown if an attempt is made to set the connection string while the connection is open
- Small changes to ConnectionString docs

- Removed MultiHostStream and MySqlStream. Replaced it with Common/StreamCreator
- Added support for Use Pipe connection string value
- Added Platform class for easier access to platform utility functions
- Fixed small pooling bug where new connection was not getting created after IsAlive fails
- Added Platform.cs and StreamCreator.cs
- Fixed Field.cs to properly handle 4.1 style timestamps
- Changed Common.Version to Common.DBVersion to avoid name conflict
- Fixed field.cs so that text columns return the right field type (thanks beni27@gmx.net)
- Added MySqlError class to provide some reference for error codes (thanks Geert Veenstra)

D.3.15. Version 0.74

- Added Unix socket support (thanks Mohammad DAMT [md@mt.web.id])
- only calling Thread.Sleep when no data is available
- improved escaping of quote characters in parameter data
- removed misleading comments from parameter.cs
- fixed pooling bug
- same pooling bug fixed again!! ;-)
- Fixed ConnectionString editor dialog (thanks marco p (pomarc))
- UserId now supported in connection strings (thanks Jeff Neeley)
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg)
- Added much documentation
- checked in new MultiHostStream capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added alot of documentation. Still alot to do.
- Fixed speed issue with 0.73
- changed to Thread.Sleep(0) in MySqlDataStream to help optimize the case where it doesn't need to wait (thanks Todd German)
- Prepopulating the idlepools to MinPoolSize
- Fixed MySqlPool deadlock condition as well as stupid bug where CreateNewPooledConnection was not ever adding new connections to the pool. Also fixed MySqlStream.ReadBytes and ReadByte to not use TicksPerSecond which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden)

- Added Thread.Sleep(1) to stream reading methods to be more cpu friendly (thanks Sean McGinnis)
- Fixed problem where ExecuteReader would sometime return null (thanks Lloyd Dupont)
- Fixed major bug with null field handling (thanks Naucki)
- enclosed queries for max_allowed_packet and charset inside try catch (and set defaults)
- fixed problem where socket was not getting closed properly (thanks Steve!)
- Fixed problem where ExecuteNonQuery was not always returning the right value
- Fixed InternalConnection to not use @@session.max_allowed_packet but use @@max_allowed_packet. (Thanks Miguel)
- Added many new XML doc lines
- Fixed sql parsing to not send empty queries (thanks Rory)
- Fixed problem where the reader was not unpeeking the packet on close
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi)
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed ParameterCollection.Add method to match SqlClient (thanks Joshua Mouch)
- Fixed ConnectionString parsing to handle no and yes for boolean and not lowercase values (thanks Naucki)
- Added InternalConnection class, changes to pooling
- Implemented Persist Security Info
- Added security.cs and version.cs to project
- Fixed DateTime handling in Parameter.cs (thanks Burkhard Perkens-Golomb)
- Fixed parameter serialization where some types would throw a cast exception
- Fixed DataReader to convert all returned values to prevent casting errors (thanks Keith Murray)
- Added code to Command.ExecuteReader to return null if the initial SQL command throws an exception (thanks Burkhard Perkens-Golomb)
- Fixed ExecuteScalar bug introduced with restructure
- Restructure to allow for LOCAL DATA INFILE and better sequencing of packets
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammi))
- strings can now be assigned directly to blob fields (Adam M.)
- Fixed float parameters (thanks Pent)

- Improved Parameter ctor and ParameterCollection.Add methods to better match SqlClient (thx Joshua Mouch)
- Corrected Connection.CreateCommand to return a MySqlCommand type
- Fixed connection string designer dialog box problem (thanks Abraham Guyt)
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch)
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis)
- Removed spurious MessageBox.show from DataReader code (thanks Joshua Mouch)
- Fixed a nasty bug in the split sql code (thanks everyone! :-)

D.3.16. Version 0.71

- Fixed bug in MySqlStream where too much data could attempt to be read (thanks Peter Belbin)
- Implemented HasRows (thanks Nash Pherson)
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler)
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger)
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger)
- Made MySqlException serializable (thanks Mathias Hasselmann)

D.3.17. Version 0.70

- Updated some of the character code pages to be more accurate
- Fixed problem where readers could be opened on connections that had readers open
- Release of 0.70
- Moved test to separate assembly MySqlClientTests
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin)
- Added some pipe tests
- Increased default max pool size to 50
- Compiles with Mono 0-24
- Fixed connection and data reader dispose problems
- Added String datatype handling to parameter serialization
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkens-

Golomb)

- Added support for `CommandBehavior.SingleRow` to `DataReader`
- Fixed command sql processing so quotes are better handled (thanks Theo Spears)
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out. [Thanks anonymous]
- Added `MySqlCommandStream` class to simplify timeOuts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more `SqlCommandClient` compliant so that `DataReaders` have to be closed before the connection can be used to run another command
- Improved `DBNull.Value` handling in the fields
- Added several unit tests
- Fixed `MySqlCommandException` so that the base class is actually called :-o
- Improved driver coding
- Fixed bug where `NextResult` was returning false on the last resultset
- Added more tests for MySQL
- Improved casting problems by equating unsigned 32bit values to `Int64` and unsigned 16bit values to `Int32`, and so forth.
- Added new ctor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlCommandDataReader` where it didn't check for null fieldlist before returning field count
- Started adding `MySqlCommandClient` unit tests (added `MySqlCommandClient/Tests` folder and some test cases)
- Fixed some things in Connection String handling
- Moved `INIT_DB` to `MySqlCommandPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly
- Reworked some of the internals so that all three execute methods of `Command` worked properly
- Fixed many small bugs found during benchmarking
- The first cut of `CoonnectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value ctor of `Parameter`

- Also, inferred type if value of null parameter is changed using Value property
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now Pg-Sql
- Added attribute to PgSql code to prevent designer from trying to show
- Added MySQLDbType property to Parameter object and added proper conversion code to convert from DbType to MySQLDbType)
- Removed unused ObjectToString method from MySQLParameter.cs
- Fixed Add(..) method in ParameterCollection so that it doesn't use Add(name, value) instead.
- Fixed IndexOf and Contains in ParameterCollection to be aware that parameter names are now stored without @
- Fixed Command.ConvertSQLToBytes so it only allows characters that can be in MySQL variable names
- Fixed DataReader and Field so that blob fields read their data from Field.cs and GetBytes works right
- Added simple query builder editor to CommandText property of MySQLCommand
- Fixed CommandBuilder and Parameter serialization to account for Parameters not storing @ in their names
- Removed MySQLFieldType enum from Field.cs. Now using MySQLDbType enum
- Added Designer attribute to several classes to prevent designer view when using VS.Net
- Fixed Initial catalog typo in ConnectionString designer
- Removed 3 parameter ctor for MySQLParameter that conflicted with (name, type, value)
- changed MySQLParameter so paramName is now stored without leading @ (this fixed null inserts when using designer)
- Changed TypeConverter for MySQLParameter to use the ctor with all properties

D.3.18. Version 0.68

- Fixed sequence issue in driver
- Added DbParametersEditor to make parameter editing more like SqlClient
- Fixed Command class so that parameters can be edited using the designer
- Update connection string designer to support Use Compression flag
- Fixed string encoding so that European characters like ä will work correctly
- Creating base classes to aid in building new data providers
- Added support for UID key in connection string

- Field, parameter, command now using `DBNull.Value` instead of `null`
- `CommandBuilder` using `DBNull.Value`
- `CommandBuilder` now builds insert command correctly when an `auto_insert` field is not present
- Field now uses `typeof` keyword to return `System.Types` (performance)

D.3.19. Version 0.65

- `MySQLCommandBuilder` now implemented
- Transaction support now implemented (not all table types support this)
- `GetSchemaTable` fixed to not use `xsd` (for Mono)
- Driver is now Mono-compatible!!
- `TIME` data type now supported
- More work to improve Timestamp data type handling
- Changed signatures of all classes to match corresponding `SqlClient` classes

D.3.20. Version 0.60

- Protocol compression using `SharpZipLib` (www.icsharpcode.net)
- Named pipes on Windows now working properly
- Work done to improve Timestamp data type handling
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work

D.3.21. Version 0.50

- Speed increased dramatically by removing bugging network sync code
- Driver no longer buffers rows of data (more ADO.Net compliant)
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed

D.4. MySQL Connector/J Change History

D.4.1. Changes in MySQL Connector/J 5.0.3 (26 July 2006)

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. ([Bug#20650](http://bugs.mysql.com/20650) [<http://bugs.mysql.com/20650>])

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

D.4.2. Changes in MySQL Connector/J 5.0.2-beta (11 July 2006)

- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug#17401 [<http://bugs.mysql.com/17401>])
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. (Bug#18086 [<http://bugs.mysql.com/18086>])
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug#19169 [<http://bugs.mysql.com/19169>])
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSourcees`. (Bug#20242 [<http://bugs.mysql.com/20242>])
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets.
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option).
- `MysqlXaConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the "scanning" nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager.

D.4.3. Changes in MySQL Connector/J 5.0.1-beta (Not Released)

Not released due to a packaging error

D.4.4. Changes in MySQL Connector/J 5.0.0-beta (22 December 2005)

- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.

- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Attempt detection of the MySQL type `BINARY` (it's an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Return original column name for `RSMD.getColumnNames()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it's not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. ([Bug#14729](http://bugs.mysql.com/14729) [<http://bugs.mysql.com/14729>])
- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://....`
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes).
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `' '`, `(int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support.
- Return `"[VAR]BINARY"` for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer).
- When fix for [Bug#14562](http://bugs.mysql.com/14562) [<http://bugs.mysql.com/14562>] was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`.
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to [Bug#14972](http://bugs.mysql.com/14972) [<http://bugs.mysql.com/14972>]).
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both re-

quire MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

D.4.5. Changes in MySQL Connector/J 3.1.14 (not yet released)

- Fixed updatable result set throws `ClassCastException` when there is row data and `moveToInsertRow()` is called. (Fixes [Bug#20479](http://bugs.mysql.com/20479) [<http://bugs.mysql.com/20479>])
- Fixed Updatable result set that contains a `BIT` column fails when server-side prepared statements are used. (Fixes [Bug#20485](http://bugs.mysql.com/20485) [<http://bugs.mysql.com/20485>])
- Fixed memory leak with `profileSQL=true`. (Fixes [Bug#16987](http://bugs.mysql.com/16987) [<http://bugs.mysql.com/16987>])
- Connection fails to localhost when using timeout and IPv6 is configured. (Fixes [Bug#19726](http://bugs.mysql.com/19726) [<http://bugs.mysql.com/19726>])
- Fixed `NullPointerException` in `MysqlDataSourceFactory` due to `Reference` containing `RefAddr`s with null content. (Fixes [Bug#16791](http://bugs.mysql.com/16791) [<http://bugs.mysql.com/16791>])
- Fixed `ResultSet.getShort()` for `UNSIGNED TINYINT` returns incorrect values when using server-side prepared statements. (Fixes [Bug#20306](http://bugs.mysql.com/20306) [<http://bugs.mysql.com/20306>])
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Fixes [Bug#20687](http://bugs.mysql.com/20687) [<http://bugs.mysql.com/20687>])
- Fixed [Bug#21062](http://bugs.mysql.com/21062) [<http://bugs.mysql.com/21062>] - `ResultSet.getSomeInteger()` doesn't work for `BIT(>1)`.
- Fixed [Bug#18880](http://bugs.mysql.com/18880) [<http://bugs.mysql.com/18880>] - `ResultSet.getFloatFromString()` can't retrieve values near `Float.MIN/MAX_VALUE`.
- Fixed [Bug#20888](http://bugs.mysql.com/20888) [<http://bugs.mysql.com/20888>] - escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including `NO_BACKSLASH_ESCAPES` being set, and stacked quote characters forms of escaping (i.e. `"` or `""`).
- Fixed [Bug#19993](http://bugs.mysql.com/19993) [<http://bugs.mysql.com/19993>] - `ReplicationDriver` does not always round-robin load balance depending on URL used for slaves list.

D.4.6. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

- `INOUT` parameter does not store `IN` value. ([Bug#15464](http://bugs.mysql.com/15464) [<http://bugs.mysql.com/15464>])
- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](http://bugs.mysql.com/14609) [<http://bugs.mysql.com/14609>])

- No "dos" character set in MySQL > 4.1.0. ([Bug#15544](http://bugs.mysql.com/15544) [<http://bugs.mysql.com/15544>])
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). ([Bug#15383](http://bugs.mysql.com/15383) [<http://bugs.mysql.com/15383>])
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. ([Bug#11874](http://bugs.mysql.com/11874) [<http://bugs.mysql.com/11874>])
- `lib-nodist` directory missing from package breaks out-of-box build. ([Bug#15676](http://bugs.mysql.com/15676) [<http://bugs.mysql.com/15676>])
- `DBMD.getColumns()` returns wrong type for `BIT`. ([Bug#15854](http://bugs.mysql.com/15854) [<http://bugs.mysql.com/15854>])
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. ([Bug#14938](http://bugs.mysql.com/14938) [<http://bugs.mysql.com/14938>])
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). ([Bug#16841](http://bugs.mysql.com/16841) [<http://bugs.mysql.com/16841>])
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. ([Bug#17099](http://bugs.mysql.com/17099) [<http://bugs.mysql.com/17099>])
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably. ([Bug#13469](http://bugs.mysql.com/13469) [<http://bugs.mysql.com/13469>])

If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this.

- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property.
- `LogFactory` now prepends "com.mysql.jdbc.log" to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example "logger=CommonsLogger" instead of "logger=com.mysql.jdbc.log.CommonsLogger".
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. ([Bug#15570](http://bugs.mysql.com/15570) [<http://bugs.mysql.com/15570>])
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. ([Bug#18041](http://bugs.mysql.com/18041) [<http://bugs.mysql.com/18041>])
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL.
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. ([Bug#17898](http://bugs.mysql.com/17898) [<http://bugs.mysql.com/17898>])
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. ([Bug#17587](http://bugs.mysql.com/17587) [<http://bugs.mysql.com/17587>])

[<http://bugs.mysql.com/17587>])

- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0.
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties.
- Fixed data truncation and `getWarnings()` only returns last warning in set. ([Bug#18740](#) [<http://bugs.mysql.com/18740>])
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. Fixes [Bug#18496](#) [<http://bugs.mysql.com/18496>] for `BigDecimals`.
- Fixed aliased column names where length of name > 251 are corrupted. ([Bug#18554](#) [<http://bugs.mysql.com/18554>])
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. ([Bug#17450](#) [<http://bugs.mysql.com/17450>])
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. ([Bug#19282](#) [<http://bugs.mysql.com/19282>])
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire.
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently ([Bug#13601](#) [<http://bugs.mysql.com/13601>]).
- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of `BigDecimals`. ([Bug#19615](#) [<http://bugs.mysql.com/19615>])
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. ([Bug#19282](#) [<http://bugs.mysql.com/19282>])

D.4.7. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.
- Java type conversion may be incorrect for `MEDIUMINT`. ([Bug#14562](#) [<http://bugs.mysql.com/14562>])
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `ResultSet.getTimestamp()` to return correct millis-since GMT when `ResultSet.getTime()` is called on the return value (currently default is `false` for legacy behavior).

- Fixed `DatabaseMetaData.stores*Identifiers()`:
 - If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
 - If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. ([Bug#14815](http://bugs.mysql.com/14815) [<http://bugs.mysql.com/14815>])
- Escape processor replaces quote character in quoted string with string delimiter. ([Bug#14909](http://bugs.mysql.com/14909) [<http://bugs.mysql.com/14909>])
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. ([Bug#12975](http://bugs.mysql.com/12975) [<http://bugs.mysql.com/12975>])
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse).
- Unable to initialize character set mapping tables (due to J2EE classloader differences). ([Bug#14938](http://bugs.mysql.com/14938) [<http://bugs.mysql.com/14938>])
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. ([Bug#14972](http://bugs.mysql.com/14972) [<http://bugs.mysql.com/14972>])
- `logSlowQueries` should give better info. ([Bug#12230](http://bugs.mysql.com/12230) [<http://bugs.mysql.com/12230>])
- Extraneous sleep on `autoReconnect`. ([Bug#13775](http://bugs.mysql.com/13775) [<http://bugs.mysql.com/13775>])
- Driver incorrectly closes streams passed as arguments to `PreparedStatement`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). ([Bug#15024](http://bugs.mysql.com/15024) [<http://bugs.mysql.com/15024>])

- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048 [<http://bugs.mysql.com/13048>])
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065 [<http://bugs.mysql.com/15065>])
- Don't increase timeout for failover/reconnect. (Bug#6577 [<http://bugs.mysql.com/6577>])
- Process escape tokens in `Connection.prepareStatement(...)`. (Bug#15141 [<http://bugs.mysql.com/15141>]) You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`.
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255 [<http://bugs.mysql.com/13255>])

D.4.8. Changes in MySQL Connector/J 3.1.11-stable (07 October 2005)

- Spurious `!` on console when character encoding is `utf8`. (Bug#11629 [<http://bugs.mysql.com/11629>])
- Fixed statements generated for testcases missing `;` for “plain” statements.
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663 [<http://bugs.mysql.com/11663>])
- Fixed regression caused by fix for Bug#11552 [<http://bugs.mysql.com/11552>] that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type.
- Moved source code to Subversion repository.
- Escape tokenizer doesn't respect stacked single quotes for escapes. (Bug#11797 [<http://bugs.mysql.com/11797>])
- `GEOMETRY` type not recognized when using server-side prepared statements.
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug#11879 [<http://bugs.mysql.com/11879>])
- Properties shared between master and slave with replication connection. (Bug#12218 [<http://bugs.mysql.com/12218>])
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630 [<http://bugs.mysql.com/10630>])
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed.
- Geometry types not handled with server-side prepared statements. (Bug#12104 [<http://bugs.mysql.com/12104>])
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in `characters` is specified. (Bug#11614 [<http://bugs.mysql.com/11614>])
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug#11798

[<http://bugs.mysql.com/11798>])

- `maxPerformance.properties` mis-spells “`elideSetAutoCommits`”. (Bug#11976 [<http://bugs.mysql.com/11976>])
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575 [<http://bugs.mysql.com/11575>])
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190 [<http://bugs.mysql.com/11190>])
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115 [<http://bugs.mysql.com/11115>])
- `explainSlowQueries` hangs with server-side prepared statements. (Bug#12229 [<http://bugs.mysql.com/12229>])
- Escape processor didn't honor strings demarcated with double quotes. (Bug#11498 [<http://bugs.mysql.com/11498>])
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side).
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`.
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`.
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`: (Bug#12541 [<http://bugs.mysql.com/12541>])
 - `getBestRowIdentifier()`
 - `getColumns()`
 - `getCrossReference()`
 - `getExportedKeys()`
 - `getImportedKeys()`
 - `getIndexInfo()`
 - `getPrimaryKeys()`
 - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
 - `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.

- Specifying " " means “current” catalog, even though this isn't quite JDBC spec compliant, it's there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc-bc2.optional` package (connections built by `ConnectionPoolDataSource` instances).
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list.
- Tokenizer for = in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. ([Bug#12753](http://bugs.mysql.com/12753) [<http://bugs.mysql.com/12753>])
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. ([Bug#11781](http://bugs.mysql.com/11781) [<http://bugs.mysql.com/11781>])
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M.
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters.
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](http://bugs.mysql.com/12417) [<http://bugs.mysql.com/12417>])
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. ([Bug#12752](http://bugs.mysql.com/12752) [<http://bugs.mysql.com/12752>])
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. ([Bug#12970](http://bugs.mysql.com/12970) [<http://bugs.mysql.com/12970>])
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`.
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. ([Bug#13277](http://bugs.mysql.com/13277) [<http://bugs.mysql.com/13277>])
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types.
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it).
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch.
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it's reading the response to the empty `LOAD DATA INFILE` packet sent to the server.
- Workaround for [Bug#13374](http://bugs.mysql.com/13374) [<http://bugs.mysql.com/13374>]: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a

`ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances).

- URL configuration parameters don't allow '&' or '=' in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>). (Bug#13453 [<http://bugs.mysql.com/13453>])

If the '%' character is present in a configuration property, it must now be represented as %25, which is the encoded form of '%' when using application/x-www-form-urlencoded encoding.

- The configuration property `sessionVariables` now allows you to specify variables that start with the '@' sign.
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043 [<http://bugs.mysql.com/13043>])

D.4.9. Changes in MySQL Connector/J 3.1.10-stable (23 June 2005)

- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.
- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.

D.4.10. Changes in MySQL Connector/J 3.1.9-stable (22 June 2005)

- Overhaul of character set configuration, everything now lives in a properties file.
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064 [<http://bugs.mysql.com/9064>])
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144 [<http://bugs.mysql.com/10144>])
- Actually write manifest file to correct place so it ends up in the binary jar file.
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work.
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for UN-

- `SIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. ([Bug#10156](http://bugs.mysql.com/10156) [<http://bugs.mysql.com/10156>])
- Double quotes not recognized when parsing client-side prepared statements. ([Bug#10155](http://bugs.mysql.com/10155) [<http://bugs.mysql.com/10155>])
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`.
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements.
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions.
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it.
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact.
- Driver doesn't support `{?=CALL(. . .)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. ([Bug#10310](http://bugs.mysql.com/10310) [<http://bugs.mysql.com/10310>])
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTs`. ([Bug#10485](http://bugs.mysql.com/10485) [<http://bugs.mysql.com/10485>])
- The datatype returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`.
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eu-cjpm`. ([Bug#10496](http://bugs.mysql.com/10496) [<http://bugs.mysql.com/10496>])
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`.
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`.
- 0-length streams not sent to server when using server-side prepared statements. ([Bug#10850](http://bugs.mysql.com/10850) [<http://bugs.mysql.com/10850>])
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches.
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connec-

tion will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event.

- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required.
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[, ?]` in statements being prepared, as the server supports those types of queries now.
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. ([Bug#11115](http://bugs.mysql.com/11115) [<http://bugs.mysql.com/11115>])
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog.
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
 - `maxPerformance` — maximum performance without being reckless
 - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
 - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query.
- `autoReconnect` ping causes exception on connection startup. ([Bug#11259](http://bugs.mysql.com/11259) [<http://bugs.mysql.com/11259>])
- Connector/J dumping query into `SQLException` twice. ([Bug#11360](http://bugs.mysql.com/11360) [<http://bugs.mysql.com/11360>])
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter.
- Production package doesn't include JBoss integration classes. ([Bug#11411](http://bugs.mysql.com/11411) [<http://bugs.mysql.com/11411>])
- Removed nonsensical “costly type conversion” warnings when using usage advisor.

D.4.11. Changes in MySQL Connector/J 3.1.8-stable (14 April 2005)

- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.

- `DATE_FORMAT()` queries returned as BLOBs from `getObject()`. (Bug#8868 [<http://bugs.mysql.com/8868>])
- `ServerPreparedStatements` now correctly “stream” BLOB/CLOB data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB).
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements.
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`.
- Fixed regression in `ping()` for users using `autoReconnect=true`.
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming BINARY data. (Bug#9040 [<http://bugs.mysql.com/9040>])
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive filesystems. (Bug#8800 [<http://bugs.mysql.com/8800>])
- Cannot use UTF-8 for `characterSetResults` configuration property. (Bug#9206 [<http://bugs.mysql.com/9206>])
- A continuation of Bug#8868 [<http://bugs.mysql.com/8868>], where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug#9236 [<http://bugs.mysql.com/9236>])
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug#8792 [<http://bugs.mysql.com/8792>])
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug#8803 [<http://bugs.mysql.com/8803>])
- Check for empty strings (' ') when converting CHAR/VARCHAR column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2).
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug#9320 [<http://bugs.mysql.com/9320>])
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish LIMIT clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements.
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available.
- Added support for the `c3p0` connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your `c3p0` connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MySqlConnectionTester`.
- Better detection of LIMIT inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not.

- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. ([Bug#9319](http://bugs.mysql.com/9319) [<http://bugs.mysql.com/9319>])
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection.
- Stored procedures with `DECIMAL` parameters with storage specifications that contained `'`, `'` in them would fail. ([Bug#9682](http://bugs.mysql.com/9682) [<http://bugs.mysql.com/9682>])
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances.
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. ([Bug#9704](http://bugs.mysql.com/9704) [<http://bugs.mysql.com/9704>])
- The performance metrics feature now gathers information about number of tables referenced in a `SELECT`.
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
 1. Log4j, if it's available,
 2. Then JDK1.4 logging,
 3. Then fallback to our `STDERR` logging.
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. ([Bug#9778](http://bugs.mysql.com/9778) [<http://bugs.mysql.com/9778>])
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements.
- Added a `Manifest.MF` file with implementation information to the `.jar` file.
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings.
- Should accept `null` for catalog (meaning use current) in `DBMD` methods, even though it's not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9917](http://bugs.mysql.com/9917) [<http://bugs.mysql.com/9917>])
- Should accept `null` for name patterns in `DBMD` (meaning `'%'`), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9769](http://bugs.mysql.com/9769) [<http://bugs.mysql.com/9769>])

D.4.12. Changes in MySQL Connector/J 3.1.7-stable (18 February 2005)

- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](http://bugs.mysql.com/7686) [<http://bugs.mysql.com/7686>])
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable res-

- ult sets. (Bug#7715 [<http://bugs.mysql.com/7715>])
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately.
 - Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton).
 - Infinite recursion when “falling back” to master in failover configuration. (Bug#7952 [<http://bugs.mysql.com/7952>])
 - Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration.
 - Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly.
 - Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand.
 - Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096 [<http://bugs.mysql.com/8096>])
 - Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads.
 - By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718 [<http://bugs.mysql.com/4718>])
 - Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`.
 - Always return `byte[]`s for output parameters registered as `*BINARY`.
 - Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`.
 - Fixed bug with `Connection` not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement.
 - Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`.
 - Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should).
 - `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428 [<http://bugs.mysql.com/8428>])
 - Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed.

- `PreparedStatement` not creating streaming result sets. ([Bug#8487](#) [<http://bugs.mysql.com/8487>])
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question.
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if non-rounding `BigDecimal.setScale()` fails. ([Bug#8424](#) [<http://bugs.mysql.com/8424>])
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server.
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement.
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when `< 9` bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called.

D.4.13. Changes in MySQL Connector/J 3.1.6-stable (23 December 2004)

- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.
- `DBMD.getProcedures()` doesn't respect catalog parameter. ([Bug#7026](#) [<http://bugs.mysql.com/7026>])

D.4.14. Changes in MySQL Connector/J 3.1.5-gamma (02 December 2004)

- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. ([Bug#5235](#) [<http://bugs.mysql.com/5235>])
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql_stmt_execute()”.
- Handle case when string representation of timestamp contains trailing ‘.’ with no numbers follow-

ing it.

- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706 [<http://bugs.mysql.com/5706>])
- Don't throw exceptions for `Connection.releaseSavepoint()`.
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatement` (set to old, less performant behavior by setting property `dynamicCalendars=true`).
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some usecase/jvm combinations, this is friendly on the garbage collector.
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729 [<http://bugs.mysql.com/5729>])
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225 [<http://bugs.mysql.com/6225>])
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359 [<http://bugs.mysql.com/6359>].
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359 [<http://bugs.mysql.com/6359>].
- Use null-safe-equals for key comparisons in updatable result sets.
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all "padding" zeros). (Bug#6537 [<http://bugs.mysql.com/6537>])
- Use `DatabaseMetaData.getIdentiferQuoteString()` when building DBMD queries.
- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is `< max_allowed_packet` on server.
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399 [<http://bugs.mysql.com/6399>])
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`).
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`.
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedReader`. Disable this with `useReadAheadInput=false`.
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348 [<http://bugs.mysql.com/6348>])

D.4.15. Changes in MySQL Connector/J 3.1.4-beta (04 September 2004)

- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). (Bug#4510 [<http://bugs.mysql.com/4510>])
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x.
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642 [<http://bugs.mysql.com/4642>])
- Optimized integer number parsing, enable “old” slower integer parsing using JDK classes via `useFastIntParsing=false` property.
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the `SQLState`'s “standard” description, followed by the server's error message). This property is set to `true` by default.
- `ResultSet.wasNull()` does not work for primitives if a previous `null` was returned. (Bug#4689 [<http://bugs.mysql.com/4689>])
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order.
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug#4482 [<http://bugs.mysql.com/4482>])
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed.
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug#5012 [<http://bugs.mysql.com/5012>])
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for “pseudo” bit type). (Bug#5032 [<http://bugs.mysql.com/5032>])
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`.
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance).
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`.
- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it's currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes

sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsException`.

- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle.

D.4.16. Changes in MySQL Connector/J 3.1.3-beta (07 July 2004)

- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.
- Null bitmask sent for server-side prepared statements was incorrect. ([Bug#4119](http://bugs.mysql.com/4119) [<http://bugs.mysql.com/4119>])
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`.
- Added packet debugging code (see the `enablePacketDebug` property documentation).
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes).
- Externalized more messages (on-going effort).
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. ([Bug#4311](http://bugs.mysql.com/4311) [<http://bugs.mysql.com/4311>])
- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`.
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`.

D.4.17. Changes in MySQL Connector/J 3.1.2-alpha (09 June 2004)

- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.

- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered “slow.”
- Correctly map output parameters to position given in `prepareCall()` versus order implied during `registerOutParameter()`. (Bug#3146 [http://bugs.mysql.com/3146])
- Correctly detect initial character set for servers $\geq 4.1.0$.
- Cleaned up detection of server properties.
- Support placeholder for parameter metadata for server $\geq 4.1.2$.
- `getProcedures()` does not return any procedures in result set. (Bug#3539 [http://bugs.mysql.com/3539])
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug#3540 [http://bugs.mysql.com/3540])
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520 [http://bugs.mysql.com/3520])
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate.
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1).
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804 [http://bugs.mysql.com/3804])
- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs).

D.4.18. Changes in MySQL Connector/J 3.1.1-alpha (14 February 2004)

- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.

- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Centralized setting of result set type and concurrency.
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Support for transaction savepoints (MySQL \geq 4.0.14 or 4.1.1).
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Removed `useFastDates` connection property.
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions \geq 5.0.0
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK $<$ 1.4).
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'`%`' column name patterns. ([Bug#1673](http://bugs.mysql.com/1673) [<http://bugs.mysql.com/1673>])
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch.
- Detect collation of column for `RSMD.isCaseSensitive()`.
- Fixed sending of queries larger than 16M.

- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer.
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp()`, `setDate()`.
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`.
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets.
- Display where/why a connection was implicitly closed (to aid debugging).
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called.
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359 [http://bugs.mysql.com/2359])
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`.
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server.
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch.
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements.
- Fixed charset conversion issue in `getTables()`. (Bug#2502 [http://bugs.mysql.com/2502])
- Implemented multiple result sets returned from a statement or stored procedure.
- Server-side prepared statements were not returning datatype `YEAR` correctly. (Bug#2606 [http://bugs.mysql.com/2606])
- Enabled streaming of result sets from server-side prepared statements.
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623 [http://bugs.mysql.com/2623])
- Merged unbuffered input code from 3.0.
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code.
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671 [http://bugs.mysql.com/2671])
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests.
- Use DocBook version of docs for shipped versions of drivers.

D.4.19. Changes in MySQL Connector/J 3.1.0-alpha (18 Feb-

bruary 2003)

- Added `requireSSL` property.
- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

D.4.20. Changes in MySQL Connector/J 3.0.17-ga (23 June 2005)

- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. ([Bug#5874](http://bugs.mysql.com/5874) [<http://bugs.mysql.com/5874>])
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. ([Bug#7081](http://bugs.mysql.com/7081) [<http://bugs.mysql.com/7081>])
- Support new protocol type `MYSQL_TYPE_VARCHAR`.
- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer.
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. ([Bug#7316](http://bugs.mysql.com/7316) [<http://bugs.mysql.com/7316>])
- `PreparedStatement` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. ([Bug#7033](http://bugs.mysql.com/7033) [<http://bugs.mysql.com/7033>])
- Connections starting up failed-over (due to down master) never retry master. ([Bug#6966](http://bugs.mysql.com/6966) [<http://bugs.mysql.com/6966>])
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7061](http://bugs.mysql.com/7061) [<http://bugs.mysql.com/7061>])
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](http://bugs.mysql.com/7686) [<http://bugs.mysql.com/7686>])
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1).
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7601](http://bugs.mysql.com/7601) [<http://bugs.mysql.com/7601>])
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`.
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly.

- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter.
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607 [<http://bugs.mysql.com/7607>])
- Adding `CP943` to aliases for `sjis`. (Bug#6549 [<http://bugs.mysql.com/6549>], fixed while fixing Bug#7607 [<http://bugs.mysql.com/7607>])
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug#8064 [<http://bugs.mysql.com/8064>])
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug#8812 [<http://bugs.mysql.com/8812>])
- Workaround for server Bug#9098 [<http://bugs.mysql.com/9098>]: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values.
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug#8629 [<http://bugs.mysql.com/8629>])
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version.
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`.
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later.

D.4.21. Changes in MySQL Connector/J 3.0.16-ga (15 November 2004)

- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.
- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664 [<http://bugs.mysql.com/5664>])
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type.
- Off-by-one bug in `Buffer.readString(string)`. (Bug#5664 [<http://bugs.mysql.com/5664>])
- Made `TINYINT(1) -> BIT/Boolean` conversion configurable via `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box).
- Only set `character_set_results` during connection establishment if server version `>= 4.1.1`.
- Fixed regression where `useUnbufferedInput` was defaulting to `false`.

- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664 [http://bugs.mysql.com/5664])

D.4.22. Changes in MySQL Connector/J 3.0.15-production (04 September 2004)

- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010 [http://bugs.mysql.com/4010])
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts. (**Warning:** This required a change to the `SocketFactory.connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature. (Bug#4334 [http://bugs.mysql.com/4334])
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`.
- Removed redundant calls to `checkRowPos()` in `ResultSet`.
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742 [http://bugs.mysql.com/4742])
- Added FLOSS license exemption.
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808 [http://bugs.mysql.com/4808])
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4138 [http://bugs.mysql.com/4138], Bug#4860 [http://bugs.mysql.com/4860])
- “Production” is now “GA” (General Availability) in naming scheme of distributions.
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for non-binary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn’t distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug#4880 [http://bugs.mysql.com/4880])
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022 [http://bugs.mysql.com/5022])
- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069 [http://bugs.mysql.com/5069])
- Parse new time zone variables from 4.1.x servers.
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion.

D.4.23. Changes in MySQL Connector/J 3.0.14-production (28 May 2004)

- Fixed URL parsing error.

D.4.24. Changes in MySQL Connector/J 3.0.13-production (27 May 2004)

- Using a `MySQLDataSource` without server name fails. ([Bug#3848](http://bugs.mysql.com/3848) [<http://bugs.mysql.com/3848>])
- `No Database Selected` when using `MysqlConnectionPoolDataSource`. ([Bug#3920](http://bugs.mysql.com/3920) [<http://bugs.mysql.com/3920>])
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. ([Bug#3873](http://bugs.mysql.com/3873) [<http://bugs.mysql.com/3873>])

D.4.25. Changes in MySQL Connector/J 3.0.12-production (18 May 2004)

- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPoolDataSource` so that passing of other properties is possible from inside appservers.
- Map duplicate key and foreign key errors to `SQLState` of `23000`.
- Backport documentation tooling from 3.1 branch.
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. ([Bug#2957](http://bugs.mysql.com/2957) [<http://bugs.mysql.com/2957>])
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. ([Bug#103](http://bugs.mysql.com/103) [<http://bugs.mysql.com/103>]).
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and/or `setBinary/CharacterStream()`. ([Bug#2670](http://bugs.mysql.com/2670) [<http://bugs.mysql.com/2670>]).
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting.
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers `>=`

4.1.2.

- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets.
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL \geq 4.1.0.
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column.
- Only set `character_set_results` for MySQL \geq 4.1.0.
- `StringUtilsils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. ([Bug#3511](http://bugs.mysql.com/3511) [<http://bugs.mysql.com/3511>])
- Renamed `StringUtilsils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`.
- Not specifying database in URL caused `MalformedURLException` exception. ([Bug#3554](http://bugs.mysql.com/3554) [<http://bugs.mysql.com/3554>])
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property.
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly.
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse).
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. ([Bug#3557](http://bugs.mysql.com/3557) [<http://bugs.mysql.com/3557>])
- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. ([Bug#3570](http://bugs.mysql.com/3570) [<http://bugs.mysql.com/3570>])
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](http://bugs.mysql.com/3520) [<http://bugs.mysql.com/3520>])
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings.
- Made `StringRegressionTest` 4.1-unicode aware.

D.4.26. Changes in MySQL Connector/J 3.0.11-stable (19 February 2004)

- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.
- `AutoReconnect` time was growing faster than exponentially. ([Bug#2447](http://bugs.mysql.com/2447) [<http://bugs.mysql.com/2447>])
- Fixed failover always going to last host in list. ([Bug#2578](http://bugs.mysql.com/2578) [<http://bugs.mysql.com/2578>])
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue [ht-](#)

[tp://developer.java.sun.com/developer/bugParade/bugs/4401235.html](http://developer.java.sun.com/developer/bugParade/bugs/4401235.html))

- Detect on/off or 1, 2, 3 form of `lower_case_table_names` value on server.
- Return `java.lang.Integer` for TINYINT and SMALLINT types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852 [<http://bugs.mysql.com/2852>])
- Return `java.lang.Double` for FLOAT type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855 [<http://bugs.mysql.com/2855>])
- Return `[B` instead of `java.lang.Object` for BINARY, VARBINARY and LONGVARBINARY types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance).
- Issue connection events on all instances created from a `ConnectionPoolDataSource`.

D.4.27. Changes in MySQL Connector/J 3.0.10-stable (13 January 2004)

- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511 [<http://bugs.mysql.com/1511>])
- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534 [<http://bugs.mysql.com/1534>])
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch.
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug#1695 [<http://bugs.mysql.com/1695>])
- Barge blobs and split packets not being read correctly. (Bug#1576 [<http://bugs.mysql.com/1576>])
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements.
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630 [<http://bugs.mysql.com/1630>])
- Fix for 4.1.1-style authentication with no password.
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731 [<http://bugs.mysql.com/1731>])
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775 [<http://bugs.mysql.com/1775>])
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592 [<http://bugs.mysql.com/1592>])
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type.
- `ResultSet.getObject()` on TINYINT and SMALLINT columns should return Java type `Integer`. (Bug#1913 [<http://bugs.mysql.com/1913>])
- Added `alwaysClearStream` connection property, which causes the driver to always empty any

remaining data on the input stream before each query.

- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server.
- Autoreconnect code didn't set catalog upon reconnect if it had been changed.
- Implement `ResultSet.updateClob()`.
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns.
- Connection property `maxRows` not honored. (Bug#1933 [<http://bugs.mysql.com/1933>])
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925 [<http://bugs.mysql.com/1925>])
- Support escape sequence `{fn convert ... }`. (Bug#1914 [<http://bugs.mysql.com/1914>])
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug#1958 [<http://bugs.mysql.com/1958>])
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006 [<http://bugs.mysql.com/2006>])
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`.
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`.
- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default).
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible.
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`).
- Use constants for `SQLStates`.
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer.
- Ensure that `Buffer.writeString()` saves room for the `\0`.
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0
- Fixed mappings in `SQLException` to report deadlocks with `SQLStates` of `41000`.
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not.

D.4.28. Changes in MySQL Connector/J 3.0.9-stable (07 October 2003)

- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).

- Fixed test for end of buffer in `Buffer.readString()`.
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug#496 [http://bugs.mysql.com/496])
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query.
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug#661 [http://bugs.mysql.com/661])
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug#517 [http://bugs.mysql.com/517], Bug#664 [http://bugs.mysql.com/664])
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth).
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. (Bug#675 [http://bugs.mysql.com/675])
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug#688 [http://bugs.mysql.com/688])
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`.
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance).
- Don't try and reset isolation level on reconnect if MySQL doesn't support them.
- Don't wrap `SQLExceptions` in `RowDataDynamic`.
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug#774 [http://bugs.mysql.com/774])
- Fixed regression in large split-packet handling. (Bug#848 [http://bugs.mysql.com/848])
- Better diagnostic error messages in exceptions for “streaming” result sets.
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases).
- Don't hide messages from exceptions thrown in I/O layers.
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884 [http://bugs.mysql.com/884])
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN.
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. (Bug#879 [http://bugs.mysql.com/879])
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time.

- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug#1099 [<http://bugs.mysql.com/1099>])
- Fixed deadlock issue with `Statement.setMaxRows()`.
- Fixed `CLOB.truncate()`. (Bug#1130 [<http://bugs.mysql.com/1130>])
- Optimized `CLOB.setCharacterStream()`. (Bug#1131 [<http://bugs.mysql.com/1131>])
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug#1246 [<http://bugs.mysql.com/1246>])
- `ResultSet.get/setString` mashing char 127. (Bug#1247 [<http://bugs.mysql.com/1247>])
- Backported authentication changes for 4.1.1 and newer from 3.1 branch.
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports.
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.

D.4.29. Changes in MySQL Connector/J 3.0.8-stable (23 May 2003)

- Allow bogus URLs in `Driver.getPropertyInfo()`.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Use JVM charset with filenames and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. (Bug#378 [<http://bugs.mysql.com/378>]).
- Return correct number of generated keys when using `REPLACE` statements.
- Fix problem detecting server character set in some cases.
- Fix row data decoding error when using *very* large packets.
- Optimized row data decoding.
- Issue exception when operating on an already closed prepared statement.
- Fixed SJIS encoding bug, thanks to Naoto Sato.

- Optimized usage of `EscapeProcessor`.
- Allow multiple calls to `Statement.close()`.

D.4.30. Changes in MySQL Connector/J 3.0.7-stable (08 April 2003)

- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- 4.1 Column Metadata fixes.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- Fixed charset issues with database metadata (charset was not getting set correctly).
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Fixed escaping of `0x5c ('\\')` character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when `autoReconnecting`.

D.4.31. Changes in MySQL Connector/J 3.0.6-stable (18 February 2003)

- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.

- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Backported 4.1 charset field info changes from Connector/J 3.1.

D.4.32. Changes in MySQL Connector/J 3.0.5-gamma (22 January 2003)

- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.
- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added update options for foreign key metadata.

D.4.33. Changes in MySQL Connector/J 3.0.4-gamma (06 January 2003)

- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for quoted identifiers in `PreparedStatement` parser.
- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.

- Reduce memory footprint of `PreparedStatement` by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for 4.0.8-style large packets.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.

D.4.34. Changes in MySQL Connector/J 3.0.3-dev (17 December 2002)

- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.
- Fixed charset handling in `Fields.java`.
- Implemented `Connection.nativeSQL()`.
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `testsuite.EscapeProcessingTest`).
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).

- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the [README](#)).
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- `NamedPipeSocketFactory` now works (only intended for Windows), see [README](#) for instructions.

D.4.35. Changes in MySQL Connector/J 3.0.2-dev (08 November 2002)

- Fixed issue with updatable result sets and `PreparedStatement` not working.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed various non-ASCII character encoding issues.
- Added driver property `useHostsInPrivileges`. Defaults to true. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Added SSL support. See [README](#) for information on how to use it.
- Properly restore connection properties when `autoReconnecting` or failing-over, including `autoCommit` state, and isolation level.
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Escape `0x5c` character in strings for the SJIS charset.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Implemented `Clob.truncate()`.
- Implemented `Clob.setString()`.
- Implemented `Clob.setAsciiStream()`.

- Implemented `Clob.setCharacterStream()`.
- Added `com.mysql.jdbc.MinAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns true for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/CharacterStream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.

D.4.36. Changes in MySQL Connector/J 3.0.1-dev (21 September 2002)

- Fixed `ResultSet.getRow()` off-by-one bug.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- Added `socketTimeout` parameter to URL.
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as hostnames, ports, or usernames), as well as clearing “sensitive” data structures when possible.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Implemented `ResultSet.getCharacterStream()`.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Massive code clean-up to follow Java coding conventions (the time had come).

D.4.37. Changes in MySQL Connector/J 3.0.0-dev (31 July 2002)

- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me <mark@mysql.com>.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- JDBC Compliance: Passes all tests besides stored procedure tests.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- The driver now only works with JDK-1.2 or newer.
- Added multi-host failover support (see [README](#)).
- General source-code cleanup.
- Overall speed improvements via controlling transient object creation in `MysqlIO` class when reading packets.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.

D.4.38. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

- More code cleanup.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- Quoted identifiers not used if server version does not support them. Also, if server started with `-ansi` or `--sql-mode=ANSI_QUOTES`, `"` will be used as an identifier quote character, otherwise `'` will be used.

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- Fixed typo for `relaxAutoCommit` parameter.

D.4.39. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

- More code cleanup.
- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PreparedStatement`.
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- `ResultSetMetaData.getColumnClassName()` now implemented.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)

D.4.40. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

- General code cleanup.
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- Added `getTable/columnPrivileges()` to `DBMD` (fixes 484502).
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Added support for `BIT` types (51870) to `PreparedStatement`.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).

- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `YEAR` type (533556).
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- `ResultSet.refreshRow()` implemented.
- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.

D.4.41. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- Full synchronization of `Statement.java`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

D.4.42. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).
- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with WebSphere 4 (bug 505839).

D.4.43. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizam-

bri).

- Fixed quoting error with escape processor (bug 486265).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- Fixed casting bug in `PreparedStatement` (bug 488663).

D.4.44. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).

D.4.45. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

- `PreparedStatement.setCharacterStream()` now implemented
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.

- Fixed `ResultSet.isAfterLast()` always returning `false`.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.

D.4.46. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

D.4.47. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `Byte` to `PreparedStatement.setObject()`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.

D.4.48. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

- Implemented `getBigDecimal()` without scale component for JDBC2.

- Fixed composite key problem with updatable result sets.
- Added detection of `-/+INF` for doubles.
- Faster ASCII string operations.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.

D.4.49. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- Cleaned up exception handling when driver connects.
- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- No escape processing is done on `PreparedStatement` anymore per JDBC spec.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

D.4.50. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

D.4.51. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- Statement/PreparedStatement.getMoreResults() bug fixed. Thanks to Noel J. Bergman.
- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

D.4.52. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

D.4.53. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they don't.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character-converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)

- Changed MysqLIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to { } inside quotes.

D.4.54. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

D.4.55. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

D.4.56. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqLIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)

- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

D.4.57. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

D.4.58. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

D.4.59. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqLIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

D.4.60. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

D.4.61. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.toString() to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

D.4.62. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for

GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.

- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to `getTypeInfo()` for parameters, and so forth.
- `DatabaseMetaData` is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

D.4.63. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented `getTypeInfo()`. `Connection.rollback()` now throws an `SQLException` per the JDBC spec.
- Added `PreparedStatement` that supports all JDBC API methods for `PreparedStatement` including `InputStreams`. Please check this out and let me know if anything is broken.
- Fixed a bug in `ResultSet` that would break some queries that only returned 1 row.
- Fixed bugs in `DatabaseMetaData.getTables()`, `DatabaseMetaData.getColumns()` and `DatabaseMetaData.getCatalogs()`.
- Added functionality to `Statement` that allows `executeUpdate()` to store values for IDs that are automatically generated for `AUTO_INCREMENT` fields. Basically, after an `executeUpdate()`, look at the `SQLWarnings` for warnings like "`LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'`". If you are using `AUTO_INCREMENT` fields in your tables and are executing a lot of `executeUpdate()`s on one `Statement`, be sure to `clearWarnings()` every so often to save memory.

D.4.64. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split `MysqlIO` and `Buffer` to separate classes. Some `ClassLoaders` gave an `IllegalAccessException` error for some fields in those two classes. Now `mm.mysql` works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

D.4.65. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed `DatabaseMetadata` problems in `getColumns()` and bug in switch statement in the `Field` constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

D.4.66. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:

- We're now 15% faster than gwe's driver.
- Started working on [DatabaseMetaData](#).
- The following methods are implemented:
 - `getTables()`
 - `getTableTypes()`
 - `getColumns`
 - `getCatalogs()`

Appendix E. Porting to Other Systems

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.1.1, “Operating Systems On Which MySQL Is Known To Run”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, <Xavier.Leroy@inria.fr>.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See [mit-pthreads/README](#) and Programming POSIX Threads (<http://www.humanfactor.com/pthreads/>).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at <http://www.mit.edu/afs/sipb/project/pthreads/> and a programming introduction at http://www.mit.edu:8001/people/proven/IAP_2000/). These can be used for some operating systems that do not have POSIX threads. See [Section 2.9.5, “MIT-pthreads Notes”](#).

It is also possible to use another user level thread package named FSU Pthreads (see <http://moss.csc.ncsu.edu/~mueller/pthreads/>). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are SPARCworks, Sun Forte, Irix `cc`, HP-UX `aCC`, IBM AIX `xlC_r`), Intel `ecc/icc` and Compaq `cxx`).

Important: If you are trying to build MySQL 5.1 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see [Bug#21875](http://bugs.mysql.com/21875) [<http://bugs.mysql.com/21875>].)

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See [Section 2.9.3, “Installing from the Development Source Tree”](#).

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section E.1, “Debugging a MySQL Server”](#).

Note: Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

E.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults`

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin process-list status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, Database Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.13, “Operating System-Specific Notes”](#).

E.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc` or `egcs`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \  
-fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \  
--with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.7.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.8, “How to Report Bugs or Problems”](#)).

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

E.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it's compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big!** If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the `DBUG` package by Fred Fish. See [Section E.3, “The DBUG Package”](#).

E.1.3. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to

debug `mysqld` threads. In this case, you can only have one thread active at a time. We recommend you to upgrade to `gdb` 5.1 ASAP as thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It's very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `- -thread_cache_size='max_connections+1'`. In most cases just using `- -thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section A.4.2, "What to Do If MySQL Keeps Crashing"](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.8, “How to Report Bugs or Problems”](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

E.1.4. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.12.2, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See [Section E.1.1, “Compiling MySQL for Debugging”](#).

If the error file contains something like the following:

```
mysqld got signal 11;
The manual section 'Debugging a MySQL server' tells you how to
use a stack trace and/or the core file to produce a readable
backtrace that may help in finding out why mysqld died
Attempting backtrace. You can use the following information
to find out where mysqld died.  If you see no messages after
this, something went terribly wrong...
stack range sanity check, ok, backtrace follows
0x40077552
0x81281a0
0x8128f47
0x8127be0
0x8127995
0x8104947
0x80ff28f
0x810131b
0x80ee4bc
0x80c3c91
0x80c6b43
0x80c1fd9
0x80c1686
```

you can find where `mysqld` died by doing the following:

1. Copy the preceding numbers to a file, for example `mysqld.stack`.
2. Make a symbol file for the `mysqld` server:

```
nm -n libexec/mysqld > /tmp/mysqld.sym
```

Note that most MySQL binary distributions (except for the "debug" packages, where this information is included inside of the binaries themselves) ship with the above file, named `mysqld.sym.gz`. In this case, you can simply unpack it by doing:

```
gunzip < bin/mysqld.sym.gz > /tmp/mysqld.sym
```

3. Execute `resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack`.

This prints out where `mysqld` died. If this doesn't help you find out why `mysqld` died, you should make a bug report and include the output from the above command with the bug report.

Note however that in most cases it does not help us to just have a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, we would in most cases need to know the query that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.8, “How to Report Bugs or Problems”](#).

E.1.5. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with `--log` you should check all your tables with `myisamchk`. See [Chapter 5, Database Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with `--log`. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you are using `--log` without a file name, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 7.2.1, “Optimizing Queries with EXPLAIN”](#).

You can find the queries that take a long time to execute by starting `mysqld` with `--log-slow-queries`. See [Section 5.12.5, “The Slow Query Log”](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, Database Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.2.2, “Command Options”](#).

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

E.1.6. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.

- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with `--log-bin`. See [Section 5.12.4, “The Binary Log”](#). If you want to find a query that crashes `mysqld`, you should use `--log --log-bin`.
- When you have gotten a crashed table, stop the `mysqld` server.
- Restore the backup.
- Restart the `mysqld` server **without** `--log-bin`
- Re-execute the commands with `mysqlbinlog update-log-file | mysql`. The update log is saved in the MySQL database directory with the name `hostname-bin.#`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found a reproducible bug that should be easy to fix! FTP the tables and the binary log to <ftp://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in [Section 1.8, “How to Report Bugs or Problems”](#). (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

E.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See [Section 2.9.2, “Typical configure Options”](#).

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See [Section 1.8, “How to Report Bugs or Problems”](#).

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

E.3. The DEBUG Package

The MySQL server and most MySQL clients are compiled with the DEBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a

trace file of what the program is debugging. See [Section E.1.2, “Creating Trace Files”](#).

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It's best to use a recent distribution for MySQL 5.1 to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `-debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional `' , '` and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The currently recognized flag characters are:

Flag	Description
<code>d</code>	Enable output from <code>DEBUG_<N></code> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
<code>D</code>	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>-#D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.
<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>g</code>	Enable profiling. Create a file called <code>dbugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>p</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>S</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0. (Mostly used with <code>safemalloc</code> to find memory leaks)

t	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.
----------	---

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```

-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:0,\\mysqld.trace

```

In MySQL, common tags to print (with the `d` option) are [enter](#), [exit](#), [error](#), [warning](#), [info](#), and [loop](#).

E.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See [mysys/my_pthread.c](#) for more info.

At least the following should be changed:

[pthread_get_specific](#) should use one argument. [sigwait](#) should take two arguments. A lot of functions (at least [pthread_cond_wait](#), [pthread_cond_timedwait\(\)](#)) should return the error code on error. Now they return -1 and set [errno](#).

Another problem is that user-level threads use the [ALRM](#) signal and this aborts a lot of functions ([read](#), [write](#), [open](#)...). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed [mysys/thr_alarm.c](#) to wait between alarms with [pthread_cond_timedwait\(\)](#), but this aborts with error [EINTR](#). I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile [thr_alarm](#).
- If there are some small differences in the implementation, they may be fixed by changing [my_pthread.h](#) and [my_pthread.c](#).
- Run [thr_alarm](#). If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```

Main thread: 1
Thread 0 (5) started
Thread: 5 Waiting
process_alarm

```

```
Thread 1 (6) started
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 1 (1) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 2 (2) sec
Thread: 6 Simulation of no alarm needed
Thread: 6 Slept for 0 (3) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 4 (4) sec
Thread: 6 Waiting
process_alarm
thread_alarm
Thread: 5 Slept for 10 (10) sec
Thread: 5 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 5 (5) sec
Thread: 6 Waiting
process_alarm
process_alarm
...
thread_alarm
Thread: 5 Slept for 0 (1) sec
end
```

E.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all non-thread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it's quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.
- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really "thread aware."

Appendix F. Environment Variables

This appendix lists all the environment variables that are used directly or indirectly by MySQL. Most of these can also be found in other places in this manual.

Note that any options on the command line take precedence over values specified in option files and environment variables, and values in option files take precedence over values in environment variables.

In many cases, it is preferable to use an option file instead of environment variables to modify the behavior of MySQL. See [Section 4.3.2, “Using Option Files”](#).

Variable	Description
CXX	The name of your C++ compiler (for running <code>configure</code>).
CC	The name of your C compiler (for running <code>configure</code>).
CFLAGS	Flags for your C compiler (for running <code>configure</code>).
CXXFLAGS	Flags for your C++ compiler (for running <code>configure</code>).
DBI_USER	The default username for Perl DBI.
DBI_TRACE	Trace options for Perl DBI.
HOME	The default path for the <code>mysql</code> history file is <code>\$HOME/.mysql_history</code> .
LD_RUN_PATH	Used to specify the location of <code>libmysqlclient.so</code> .
MYSQL_DEBUG	Debug trace options when debugging.
MYSQL_GROUP_SUFFIX	Option group suffix value (like specifying <code>-defaults-group-suffix</code>).
MYSQL_HISTFILE	The path to the <code>mysql</code> history file. If this variable is set, its value overrides the default for <code>\$HOME/.mysql_history</code> .
MYSQL_HOME	The path to the directory in which the server-specific <code>my.cnf</code> file resides (as of MySQL 5.0.3).
MYSQL_HOST	The default hostname used by the <code>mysql</code> command-line client.
MYSQL_PS1	The command prompt to use in the <code>mysql</code> command-line client.
MYSQL_PWD	The default password when connecting to <code>mysqld</code> . Note that using this is insecure. See Section 5.9.6, “Keeping Your Password Secure” .
MYSQL_TCP_PORT	The default TCP/IP port number.
MYSQL_UNIX_PORT	The default Unix socket filename; used for connections to <code>localhost</code> .
PATH	Used by the shell to find MySQL programs.
TMPDIR	The directory where temporary files are created.
TZ	This should be set to your local time zone. See Section A.4.6, “Time Zone Problems” .
UMASK_DIR	The user-directory creation mask when creating directories. Note that this is <code>ANDed</code> with <code>UMASK</code> .
UMASK	The user-file creation mask when creating files.
USER	The default username on Windows and NetWare used when connecting to <code>mysqld</code> .

Appendix G. Regular Expressions

A regular expression is a powerful way of specifying a pattern for a complex search.

MySQL uses Henry Spencer's implementation of regular expressions, which is aimed at conformance with POSIX 1003.2. See [Appendix C, Credits](#). MySQL uses the extended version to support pattern-matching operations performed with the `REGEXP` operator in SQL statements. See [Section 3.3.4.7, "Pattern Matching"](#), and [Section 12.3.1, "String Comparison Functions"](#).

This appendix is a summary, with examples, of the special characters and constructs that can be used in MySQL for `REGEXP` operations. It does not contain all the details that can be found in Henry Spencer's `regex(7)` manual page. That manual page is included in MySQL source distributions, in the `regex.7` file under the `regex` directory.

A regular expression describes a set of strings. The simplest regular expression is one that has no special characters in it. For example, the regular expression `hello` matches `hello` and nothing else.

Non-trivial regular expressions use certain special constructs so that they can match more than one string. For example, the regular expression `hello|word` matches either the string `hello` or the string `word`.

As a more complex example, the regular expression `B[an]*s` matches any of the strings `Bananas`, `Baaaaas`, `Bs`, and any other string starting with a `B`, ending with an `s`, and containing any number of `a` or `n` characters in between.

A regular expression for the `REGEXP` operator may use any of the following special characters and constructs:

- `^`

Match the beginning of a string.

```
mysql> SELECT 'fo\nfo' REGEXP '^fo$';      -> 0
mysql> SELECT 'fofo' REGEXP '^fo';        -> 1
```

- `$`

Match the end of a string.

```
mysql> SELECT 'fo\no' REGEXP '^fo\no$';    -> 1
mysql> SELECT 'fo\no' REGEXP '^fo$';       -> 0
```

- `.`

Match any character (including carriage return and newline).

```
mysql> SELECT 'fofo' REGEXP '^f.*$';       -> 1
mysql> SELECT 'fo\r\nfo' REGEXP '^f.*$';   -> 1
```

- `a*`

Match any sequence of zero or more `a` characters.

```
mysql> SELECT 'Ban' REGEXP '^Ba*n';        -> 1
mysql> SELECT 'Baaan' REGEXP '^Ba*n';     -> 1
mysql> SELECT 'Bn' REGEXP '^Ba*n';        -> 1
```

- `a+`

Match any sequence of one or more `a` characters.

```
mysql> SELECT 'Ban' REGEXP '^Ba+n';      -> 1
mysql> SELECT 'Bn' REGEXP '^Ba+n';     -> 0
```

- `a?`

Match either zero or one `a` character.

```
mysql> SELECT 'Bn' REGEXP '^Ba?n';     -> 1
mysql> SELECT 'Ban' REGEXP '^Ba?n';    -> 1
mysql> SELECT 'Baan' REGEXP '^Ba?n';   -> 0
```

- `de|abc`

Match either of the sequences `de` or `abc`.

```
mysql> SELECT 'pi' REGEXP 'pi|apa';    -> 1
mysql> SELECT 'axe' REGEXP 'pi|apa';   -> 0
mysql> SELECT 'apa' REGEXP 'pi|apa';   -> 1
mysql> SELECT 'apa' REGEXP '^(pi|apa)$'; -> 1
mysql> SELECT 'pi' REGEXP '^(pi|apa)$'; -> 1
mysql> SELECT 'pix' REGEXP '^(pi|apa)$'; -> 0
```

- `(abc)*`

Match zero or more instances of the sequence `abc`.

```
mysql> SELECT 'pi' REGEXP '^(pi)*$';   -> 1
mysql> SELECT 'pip' REGEXP '^(pi)*$';  -> 0
mysql> SELECT 'pipi' REGEXP '^(pi)*$'; -> 1
```

- `{1}, {2, 3}`

`{n}` or `{m, n}` notation provides a more general way of writing regular expressions that match many occurrences of the previous atom (or “piece”) of the pattern. `m` and `n` are integers.

- `a*`

Can be written as `a{0, }`.

- `a+`

Can be written as `a{1, }`.

- `a?`

Can be written as `a{0, 1}`.

To be more precise, `a{n}` matches exactly `n` instances of `a`. `a{n, }` matches `n` or more instances of `a`. `a{m, n}` matches `m` through `n` instances of `a`, inclusive.

`m` and `n` must be in the range from 0 to `RE_DUP_MAX` (default 255), inclusive. If both `m` and `n` are given, `m` must be less than or equal to `n`.

```
mysql> SELECT 'abcde' REGEXP 'a[bcd]{2}e'; -> 0
mysql> SELECT 'abcde' REGEXP 'a[bcd]{3}e'; -> 1
mysql> SELECT 'abcde' REGEXP 'a[bcd]{1,10}e'; -> 1
```

- `[a-dX], [^a-dX]`

Matches any character that is (or is not, if `^` is used) either `a`, `b`, `c`, `d` or `X`. A `-` character between two other characters forms a range that matches all characters from the first character to the second. For example, `[0-9]` matches any decimal digit. To include a literal `]` character, it must immediately follow the opening bracket `[`. To include a literal `-` character, it must be written first or last. Any character that does not have a defined special meaning inside a `[]` pair matches only itself.

```
mysql> SELECT 'aXbc' REGEXP '[a-dXYZ]';           -> 1
mysql> SELECT 'aXbc' REGEXP '^[a-dXYZ]$';       -> 0
mysql> SELECT 'aXbc' REGEXP '^[a-dXYZ]+$';     -> 1
mysql> SELECT 'aXbc' REGEXP '^[^a-dXYZ]+$';    -> 0
mysql> SELECT 'gheis' REGEXP '^[^a-dXYZ]+$';   -> 1
mysql> SELECT 'gheisa' REGEXP '^[^a-dXYZ]+$';  -> 0
```

- `[.characters.]`

Within a bracket expression (written using `[` and `]`), matches the sequence of characters of that collating element. `characters` is either a single character or a character name like `newline`. You can find the full list of character names in the `regexp/cname.h` file.

```
mysql> SELECT '~' REGEXP '[[.~.]]';             -> 1
mysql> SELECT '~' REGEXP '[[.tilde.]]';        -> 1
```

- `[=character_class=]`

Within a bracket expression (written using `[` and `]`), `[=character_class=]` represents an equivalence class. It matches all characters with the same collation value, including itself. For example, if `o` and `(+)` are the members of an equivalence class, then `[=o=]`, `[=(+)=]`, and `[o(+)]` are all synonymous. An equivalence class may not be used as an endpoint of a range.

- `[:character_class:]`

Within a bracket expression (written using `[` and `]`), `[:character_class:]` represents a character class that matches all characters belonging to that class. The following table lists the standard class names. These names stand for the character classes defined in the `ctype(3)` manual page. A particular locale may provide other class names. A character class may not be used as an endpoint of a range.

<code>alnum</code>	Alphanumeric characters
<code>alpha</code>	Alphabetic characters
<code>blank</code>	Whitespace characters
<code>cntrl</code>	Control characters
<code>digit</code>	Digit characters
<code>graph</code>	Graphic characters
<code>lower</code>	Lowercase alphabetic characters
<code>print</code>	Graphic or space characters
<code>punct</code>	Punctuation characters
<code>space</code>	Space, tab, newline, and carriage return
<code>upper</code>	Uppercase alphabetic characters
<code>xdigit</code>	Hexadecimal digit characters

```
mysql> SELECT 'justalnums' REGEXP '[:alnum:]+'; -> 1
mysql> SELECT '!!!' REGEXP '[:alnum:]+';      -> 0
```

- `[[:<:]], [[:>:]]`

These markers stand for word boundaries. They match the beginning and end of words, respectively. A word is a sequence of word characters that is not preceded by or followed by word characters. A word character is an alphanumeric character in the `alnum` class or an underscore (`_`).

```
mysql> SELECT 'a word a' REGEXP '[[:<:]]word[[:>:]]'; -> 1
mysql> SELECT 'a xword a' REGEXP '[[:<:]]word[[:>:]]'; -> 0
```

To use a literal instance of a special character in a regular expression, precede it by two backslash (`\`) characters. The MySQL parser interprets one of the backslashes, and the regular expression library interprets the other. For example, to match the string `1+2` that contains the special `+` character, only the last of the following regular expressions is the correct one:

```
mysql> SELECT '1+2' REGEXP '1+2'; -> 0
mysql> SELECT '1+2' REGEXP '1\+2'; -> 0
mysql> SELECT '1+2' REGEXP '1\\+2'; -> 1
```

Appendix H. Limits in MySQL

This Appendix lists current limits in MySQL 5.1.

H.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

Appendix I. Feature Restrictions

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

I.1. Restrictions on Stored Routines and Triggers

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of restrictions apply only to stored functions, and not to stored procedures.

All of the restrictions for stored functions also apply to triggers.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The locking statements `LOCK TABLES`, `UNLOCK TABLES`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`). Implication: You cannot use dynamic SQL within stored routines (where you construct dynamically statements as strings and then execute them). This restriction is lifted as of MySQL 5.0.13 for stored procedures; it still applies to stored functions and triggers.

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that do explicit or implicit commit or rollback.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and `SHOW` statements. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 18.2.7.3, “SELECT ... INTO Statement”](#).
- `FLUSH` statements.
- Recursive statements. That is, stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

Note that although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, although you can use `FLUSH` in a stored procedure, such a stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

```
END ;
```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that table columns do not take precedence over variables is non-standard.

Use of stored routines can cause replication problems. This issue is discussed further in [Section 18.5, “Binary Logging of Stored Routines and Triggers”](#).

`INFORMATION_SCHEMA` does not yet have a `PARAMETERS` table, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements.

There are no stored routine debugging facilities.

`CALL` statements cannot be prepared. This true both for server-side prepared statements and for SQL prepared statements.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

The `RENAME DATABASE` statement does not migrate stored routines to the new schema name. See [Section 13.1.15, “RENAME DATABASE Syntax”](#).

For triggers, the following additional statements or operations are disallowed:

- Triggers currently are not activated by foreign key actions.
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.

I.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API via the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read-only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are non-holdable (not held open after a commit).

Cursors are asensitive.

Cursors are non-scrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLES`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

I.3. Restrictions on Subqueries

- Known bug to be fixed later: If you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE`.
- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for `IN(value_list)` constructs.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return M and N rows, respectively, the execution time becomes on the order of $O(M \times N)$, rather than $O(M + N)$ as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` construct that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because the result from a subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
 - For `expr IN (subquery)`, `expr` can be an n -tuple (specified via row constructor syntax) and the subquery can return rows of n -tuples.
 - For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of n -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the

subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a, ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
 - It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.
 - Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with non-correlated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results.
- Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

I.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view. This limitation will be lifted in the future.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section I.3, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition (which invalidates the view) and no warning results from the drop or alter operation. An error occurs later when the view is used.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view contents seen each time the statement is executed later will be the contents of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT 1;
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT 2;
EXECUTE s;
```

The result returned by the `EXECUTE` statement is 1, not 2.

- If a statement in a stored routine refers to a view, the view contents seen by the statement are its con-

tents the first time that statement is executed. For example, this means that if the statement is executed in a loop, further iterations of the statement see the same view contents, even if the view definition is changed later in the loop. Example:

```
CREATE VIEW v AS SELECT 1;
delimiter //
CREATE PROCEDURE p ( )
BEGIN
  DECLARE i INT DEFAULT 0;
  WHILE i < 5 DO
    SELECT * FROM v;
    SET i = i + 1;
    ALTER VIEW v AS SELECT 2;
  END WHILE;
END;
//
delimiter ;
CALL p();
```

When the procedure `p ()` is called, the `SELECT` returns 1 each time through the loop, even though the view definition is changed within the loop.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](http://bugs.mysql.com/22062) [http://bugs.mysql.com/22062].

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

I.5. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

The MySQL XA implementation is for “external XA,” where a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. “Internal XA” is not implemented. This would allow individual storage engines within a MySQL server to act as RMs, and the server itself to act as a TM. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA is incomplete because it requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

Appendix J. GNU General Public License

Version 2, June 1991

Copyright © 1989, 1991 Free Software Foundation, Inc.
59 Temple Place - Suite 330, Boston, MA 02111-1307, USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software---to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

1. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The ``Program'', below, refers to any such program or work, and a ``work based on the Program'' means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term ``modification".) Each licensee is

addressed as ``you''.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

2. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

3. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
 - a. You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
 - b. You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
 - c. If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

4. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
 - a. Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

- b. Accompany it with a written offer, valid for at least three years, to give any third-party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c. Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

- 5. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.
- 6. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.
- 7. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.
- 8. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the

integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

9. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
10. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and ``any later version'', you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

11. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

12. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM ``AS IS'' WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.
13. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the ``copyright" line and a pointer to where the full notice is found.

```
one line to give the program's name and a brief idea of what it does.
Copyright (C) yyyy name of author

This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; either version 2 of the License, or
(at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program; if not, write to the Free Software
Foundation, Inc., 59 Temple Place - Suite 330, Boston, MA 02111-1307, USA.
```

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) 19yy name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items---whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a ``copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.

signature of Ty Coon, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

Appendix K. MySQL FLOSS License Exception

The MySQL AB Exception for Free/Libre and Open Source Software-only Applications Using MySQL Client Libraries (the "FLOSS Exception").

Version 0.5, 30 August 2006

Exception Intent

We want specified Free/Libre and Open Source Software ("FLOSS") applications to be able to use specified GPL-licensed MySQL client libraries (the "Program") despite the fact that not all FLOSS licenses are compatible with version 2 of the GNU General Public License (the "GPL").

Legal Terms and Conditions

As a special exception to the terms and conditions of version 2.0 of the GPL:

1. You are free to distribute a Derivative Work that is formed entirely from the Program and one or more works (each, a "FLOSS Work") licensed under one or more of the licenses listed below in section 1, as long as:
 - a. You obey the GPL in all respects for the Program and the Derivative Work, except for identifiable sections of the Derivative Work which are not derived from the Program, and which can reasonably be considered independent and separate works in themselves,
 - b. all identifiable sections of the Derivative Work which are not derived from the Program, and which can reasonably be considered independent and separate works in themselves,
 - i. are distributed subject to one of the FLOSS licenses listed below, and
 - ii. the object code or executable form of those sections are accompanied by the complete corresponding machine-readable source code for those sections on the same medium and under the same FLOSS license as the corresponding object code or executable forms of those sections, and
 - c. any works which are aggregated with the Program or with a Derivative Work on a volume of a storage or distribution medium in accordance with the GPL, can reasonably be considered independent and separate works in themselves which are not derivatives of either the Program, a Derivative Work or a FLOSS Work.

If the above conditions are not met, then the Program may only be copied, modified, distributed or used under the terms and conditions of the GPL or another valid licensing option from MySQL AB.

2. FLOSS License List

License name	Version(s)/Copyright Date
Academic Free License	2.0
Apache Software License	1.0/1.1/2.0
Apple Public Source License	2.0
Artistic license	From Perl 5.8.0
BSD license	"July 22 1999"
Common Public License	1.0
GNU Library or "Lesser" General Public License (LGPL)	2.0/2.1
Jabber Open Source License	1.0

MIT license	—
Mozilla Public License (MPL)	1.0/1.1
Open Software License	2.0
OpenSSL license (with original SSLeay license)	"2003" ("1998")
PHP License	3.0
Python license (CNRI Python License)	—
Python Software Foundation License	2.1.1
Sleepycat License	"1999"
University of Illinois/NCSA Open Source License	—
W3C License	"2001"
X11 License	"2001"
Zlib/libpng License	—
Zope Public License	2.0

Due to the many variants of some of the above licenses, we require that any version follow the 2003 version of the Free Software Foundation's Free Software Definition (<http://www.gnu.org/philosophy/free-sw.html>) or version 1.9 of the Open Source Definition by the Open Source Initiative (<http://www.opensource.org/docs/definition.php>).

3. Definitions

- a. Terms used, but not defined, herein shall have the meaning provided in the GPL.
- b. Derivative Work means a derivative work under copyright law.

4. **Applicability:** This FLOSS Exception applies to all Programs that contain a notice placed by MySQL AB saying that the Program may be distributed under the terms of this FLOSS Exception. If you create or distribute a work which is a Derivative Work of both the Program and any other work licensed under the GPL, then this FLOSS Exception is not available for that work; thus, you must remove the FLOSS Exception notice from that work and comply with the GPL in all respects, including by retaining all GPL notices. You may choose to redistribute a copy of the Program exclusively under the terms of the GPL by removing the FLOSS Exception notice from that copy of the Program, provided that the copy has never been modified by you or any third party.

Appendix A. Qualified Libraries and Packages

The following is a non-exhaustive list of libraries and packages which are covered by the FLOSS License Exception. Please note that this appendix is provided merely as an additional service to specific FLOSS projects wishing to simplify licensing information for their users. Compliance with one of the licenses noted under the “FLOSS license list” section remains a prerequisite.

Package Name	Qualifying License and Version
Apache Portable Runtime (APR)	Apache Software License

	2.0
